alfalfa that are perfect on corn. We have used whatever power the ranch afforded, the first was the old straw and brush-burning engine that I had left from the days of grain farm. Then later a gasoline engine used for pumping from irrigation wells has been the power. The amount of power needed will be easily found out when you decide on the cutter and blower, but certainly not less than twenty, for I am not at all satisfied with the work of the 15-horse power gasoline engine.—M. E. Sherman.

PROGRAM CALIFORNIA LIVE STOCK BREEDERS.

At the Chamber of Commerce, Sacramento, September 11, will be given the following programme:

President's Address.

"The Brood Sow," G. A. Murphy.

"Milking Shorthorns," John Lynch.

Address, Prof. W. L. Carlyle, University of Colorado.

"Herefords," Col. J. J. Steadman.

"The Jersey as an Economic Dairy Animal in California," Claud D. Tribble.

Hon. W. M. Hays, Assistant Secretary of Agriculture, Washington, D. C., is expected and if present will address the convention.

Annual Business Meeting, Thursday, September 12, 1907, Chamber of Commerce 5 p.m.

A GOOD HINT ON MILKING.

Mr. A. F. Sorenson, of Howard Co., Neb., writes a very thoughtful article to the Homestead on his method of breaking young heifers to be milked. His method, as described, is as follows:

About fifteen or twenty minutes before the cow is milked the first time the lard should be applied to the teats and when through milking wipe the teats perfectly dry with a dry soft cloth and apply the lard again. This was usually found necessary for about five or six milkings. Many milkers have the bad habit of wetting their fingers when milking, and when the teats of young cows are left in this condition, especially in the winter time, they get sore, while lard heals or takes away the soreness

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

that is so natural, considering that many milkers have rough, hard hands and considering that the teats are not accustomed to the milking process.

I once visited a farm where they had a fine, young Holstein cow, which had just come in for the first time, and the milker and the poor animal had gone through most everything during the first three milkings. The cow had no means of telling her sufferings except with kicks, and the owner, although a kind, intelligent person, could not think of other methods to apply, except what he had used so often before with other cows—tying her with straps or ropes. He decided then to let her keep the calf, as it seemed an impossibility to milk her. It was then that I happened to have my attention called to it, so I told him of our method, which we at that time had tried only with three or four young cows. He simply laughed at me when I suggested that I would myself apply the lard. But the poor cow's teats were now so sore that she would not even let the calf touch her. With considerable patting and rubbing and kind words, I had the satisfaction of getting the

When You Milk a Pratt-Fed Cow Take a Double Size Bucket

How One Cow's Milk Yield Was Increased From 1 Quart to 3 Gallons a Day

Mr. C. D. Levesque, of Ironside, Quebec, Canada, had a cow suffering from an attack of indigestion that refused to eat—looked as poor as a crow, and was giving only a quart of milk a day when three weeks calved. He got Pratts Animal Regulator and within three days the cow could eat a full meal and in less than six weeks she was giving *three gallons* of milk a day.

Pratts Animal Regulator

is a preparation of rare and costly roots and herbs, imported from Europe, Asia and Africa.

You get more milk, richer milk, and better milk by using Pratts Animal Regulator, and at the same time keep your cows strong and healthy.

25-pound bag, \$3.25. Smaller sizes also.

ADVICE FREE

If there is anything wrong with any of your live stock—poultry, horses, cows, hogs or sheep—be sure to write to us. Our expert veterinarians will write and tell you what to do immediately.

DOUBLE GUARANTEE

Each package of Pratts Animal Regulator is accompanied by a written guarantee from the Pratt Food Company, which is signed by the President of the Company and also by your dealer.

Our new books are now being printed. Regular price, 25 cents, but **FREE** to you if you send your name and address, mentioning which you want:

A NEW BREED OF DRAFT HORSES.

The Iowa State College at Ames is co-operating with the United States government in a breeding experiment to establish a breed of grey draft horses. An importation of grey Shires and Clydesdales arrived at Ames about two weeks ago and they are to be used as the foundation stock in this work.

The object of the experiment is to combine and improve the qualities of the highest excellence of each breed, so far as possible, and to eliminate some of the characteristics that are objectionable from the American standpoint. It is the intention to combine the feet, quality, pasterns and action of the Clydesdale with the more massive proportions of the Shire and, while doing so, to establish the grey color and other essential characteristics which will eventually lead to the development of an American breed of draft horses better adapted to American conditions than any of the foreign breeds.

It is the opinion of the best informed horsemen that the crossing of these breeds will not be attended with the usual uncertain results of cross-breeding experiments, as they have practically the same origin and have been bred along quite similar lines for many generations. Lawrence Drew, the most successful Clydesdale breeder of his time, unquestionably made use of Shire blood in his operations and the famous sire, Prince of Wales, is generally conceded to have had a Shire dam. Moreover, some of the most noted geldings seen in American show rings in recent years have combined the blood of these two breeds.

In adhering to the grey color there will be no radical departure from the original characteristics of these breeds, as grey has been a common, if not a prevailing color of both breeds, and many of the best specimens of each breed are still found among the greys. In America grey is the popular draft horse color and, other things being equal, a grey gelding commands more money on the market than one of any other color.

A study of blood lines and draft types decided Secretary Wilson of the United States Department of Agriculture and Professor Curtiss and Kennedy of the Iowa State College, to select the Shire and Clydesdale breeds for the beginning of the experiment, though some of the grey Percheron blood may possibly be used later in the progress of the experiment.

The importation consists of eight animals, one stallion and two mares of the Clydesdale breed, and one stallion and four mares of the Shire breed. These individuals are all of out-standing excellence. Professor W. J. Kennedy picked them from the cream of European studs, and they are an ideal bunch to start the great experimental breed on the way to popularity.

This experiment is already attracting much attention. The work with

horses at Fort Collins, Colorado, started two years ago is of a kindred sort except at that point the Government is working toward a breed of carriage horses, while at Ames it is in the interest of the drafters. The Federal Government in both instances is furnishing one-half of the funds to carry on the work. Another important will probably be made next year.

MILK FEVER.

A great many theories have been advanced to explain the cause of milk fever, but none have stood the test of time and investigation. The theory that has given anything like a satisfactory explanation is that Schmidt, German veterinarian, claims that the disease is due to a bacterial affection of the milk in the udder. While this theory will not count for many of the facts in connection with the disease, the treatment based upon it gives the best results of any line of treatment that has as yet been advocated. This consisted in injecting medicine into the udder through the teats. More recently it has been found that an injection of sterilized air works just as well, and an instrument for this purpose may be procured from any veterinary instrument maker. But it is not so much the treatment as it is the prevention of the disease that we wish to discuss.

The conditions that most frequently exist where cows are affected, may be said that fatness is one of the most constant present. Among others are lack of exercise, poorly ventilated barns and constipation. Now what do these facts indicate to show us? Nothing more or less than this: If we remove them we largely, or wholly prevent the disease. If this is the case, and we believe it is, the question arises how can this be done with the least trouble and expense. One of the easiest and best things to do to reduce the quantity of the milk a couple of weeks before the cow is due to calve. Furthermore, easily digested foods should be given that are rather laxative, such as bran, cake meal, cottonseed meal, etc. In addition to this give exercise by allowing the animal, when practicable, the run of a good sized barn lot, where this is not practicable, give the exercise by having her led or driven about each day. Keep the stable well ventilated. If such care is taken with heavy milkers there will be but little danger of their contracting the disease. Should a cow develop under such conditions would be advisable to call a qualified veterinarian because such cases usually call for some additional treatment to that of the inflation of the udder with sterilized air.

The Ornamental Garden

THIS MONTH.

Time is drawing closer for early fall garden work. Prick off gladioli, Cinerarias and Primroses last month into small pots, continue sowing same for succulents. Pansies can be grown better in pots, as they are not so liable to be attacked by red spider. Sow hardy annuals and perennials as pansies and Stock-scabiosa and geraniums. Commence planting hyacinths, tulips, anemones, crocus, daffodils, narcissus and other Dutch bulbs by the end of the month. To give roses plenty of water fertilize.

WORK ON THE LAWN.

It is a good time of the year to work on the lawn. Keep it growing well trimmed. Don't you know a green lawn is the handsomest ornament a California home can boast. You can take your friends out to some rare plant and their "ohs"

STARTING PANSIES.

The bright little pansy face which greets one from its flower bed is a flower loved by all. It is called "Heart's Ease," and is only the big sister of the humble little violet. It is wise to buy only the best seeds, for there is a vast difference between the fine and hybrid species. It is best to start pansies in the house, and this is how one woman starts her young plants, and they are always large and beautiful. She bakes the earth in the oven, which kills all the weed seeds and tiny bugs in the soil. Then this is sieved, mixed with sand, then shallow cigar boxes are filled with the mixture. Pansy seeds are sown, but in this case it is best to cover them slightly with the soft earth and moisten slightly by the absorption from the bottom of the box, or the seeds may all sprout in one place. As they grow and develop, select only the strongest for the flower beds. To make pansies flourish, they should be

may have a continuous crop by planting often. Another way to have blooms all season is to keep every bloom from going to seed, and water often.

The lawn should be kept trimmed and watered very carefully. Do not let it go long without water. It will suffer and turn brown if not watered often. Give it a good soaking once or twice a week and a good sprinkle every other evening. Look out for moles and gophers.

SOWING SEEDS.

Never sow while the soil is wet and muddy. It is better to be too dry than too wet. After the seeds are sown they may be covered by sifting over them the fine compost to the right depth. Then water artificially. Loosen the surface to keep it moist until the seedlings make their appearance.

Keep seed pods and even flowers closely picked off if you want more flowers.

We note in an exchange that roses do best near sunflowers. Is this true? Has any one ever observed any such

Kerman Water Supply

This Picture is Made from a Photograph of the Intake Dam of the Canal System That Supplies Water to the Kerman District

"ahs" compensate for a lot of work to bring it to perfection. For quiet restfulness and genuine satisfaction nothing equals a lawn.

Don't get busy with not only the one side of the house, but the back lawn as well. Please don't forget the one in the backyard.

Water it thoroughly once a week or twice often. Pull out weeds, and when pulling you loosen the dirt and make an unsightly hole drop in a little of blue grass seed, cover with a little fine stable dust. In this way the lawn continually becomes more beautiful.

Don't let it look sickly put some nitrate of soda on it, do not use it dry or put too much, or you will do more harm than good. The safest way is to put handfuls in a twelve quart water-can, dissolve in water and sprinkle in the grass.

Also start a compost heap to have well-rotted dressing a few months later.

It takes richness to make a rich lawn, but it's worth it. Many one tells you that the "lawn" is full of mosquitos tell them to "go to." No one ever saw a "wiggler" on a lawn yet.

It takes stagnant water to breed a pest, which, if you will cover with a net fixes that.

Early to bed and early to rise makes a man healthy, wealthy—or otherwise.

sheltered from all but the morning sun, blossoms must be picked each day, for it is earnest in propagating its own species. They like moderately rich garden soil, and repay any kindness shown them in beautiful flowers.

AN OLD FASHIONED FLOWER.

The Sweet William of our grandmothers is still one of the most satisfying annuals. Set out the young plants in flats or thumb pots and transplant into three-inch pots a little while before planting on the borders of the flower beds. It will be found that this care will result in more vigorous plants.

When our ancestors brought over from the old country the fashion of a flower border on the vegetable garden, they transplanted something that gave delight to many generations before moderns frowned upon old fashioned ways. There is now a disposition to go back to the flower border of our grandfathers.

Do not water roses and other shrubs that bloom freely early in the summer. They should have a rest when this blooming period is over. Withhold water and do not cultivate them. When they get dormant they may be trimmed or cut back into shape. The new growth of this season has put them all out of shape and they should be brought back.

Sweet peas may be planted now for fall or winter blooming. In fact, one

advantage to roses by having sunflowers planted near.

If you wish good dahlias be sure to give the plants all the water they require. Unless they have plenty of water they will have but few blossoms, and these will be inferior.

Do not cut the foliage away from the daffodils or tulips after they have finished blooming. Wait until the leaves are thoroughly dry before cutting them off. If this method is not observed, the succeeding year's crop will be very much impaired.

A ROOSEVELTIAN YARN.

A Washington correspondent told the other night a story that he claimed to have heard from President Roosevelt at a Gridiron club dinner.

"Two women," he said, "were discussing some new neighbors who had moved into one of the most sumptuous houses in their city.

"They seem to be very rich," said the first.

"Oh, they are," said the second.

"Shall you call?"

"Decidedly."

"You are quite sure, are you, that they are—er—quite correct, quite—er good form?"

"Oh, my dear, I'm positive," said the second woman. "They have thirty servants, eighteen horses, twelve dogs, eleven automobiles and one child."—Farm and Ranch.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance.

Our catalog tells all about it.

California Horticulturally

SOMETHING ABOUT THE CORN WORM.

MANY complaints have reached this office in relation to the destructive work of the corn worm and one correspondent asking for information, says: "I suppose most people do not know whether the parent of the worm is a bug, a beetle, a miller or a butterfly."

The parent of the corn worm is a moth, and its scientific name is *Heliothis armingeri*. It does not confine its destructive work to corn, but is to some extent an all-around pest. It is one of the worst pests of cotton and is known as the cotton-boll worm; it is also a severe pest of tomatoes, the common tomato worm being the same as the corn worm. Very many of our vegetables are subject to attack by it, and altogether it is one of the worst pests the gardener has to contend with.

The parent is a night-flying moth, measuring about an inch and a half across its expanded wings. It is yellowish in color and the wings are marked in black. The worms differ so much in color that they might be taken for different species, and range from very light to dark striped. The lighter forms are usually those which have been enclosed in their food plant and so protected from the sun.

The eggs are laid during the evening on some proper food plant and hatch in a few days. They remain in the worm form from two weeks to a month, when they leave the plant and enter the ground, where they change into a moth and in a short time come forth full fledged and ready to start another generation of corn worms.

As this worm, for the most part, burrows into the plant or the vegetable and is entirely protected from outside attacks, it is very difficult to reach. A trap crop has been suggested, that is, some crop which the first moths would attack and lay their eggs upon. This could be destroyed with the young worms, and so future generations could be prevented and a later crop planted afterwards, be comparatively freed from their attacks. This is too cumbersome and expensive a remedy to be practical, and it may be said that there is no practical remedy for the pest in either corn or tomatoes. Late fall plowing will expose those which have taken refuge in the ground for hibernating during the winter, and may be of use where the pest is very bad.

THE SULPHUR QUESTION.

Secretary of Agriculture, Hon. James Wilson, came out to the Coast a short time since for the avowed purpose of investigating its timber interests, but when he got here he found that the results of the work of his chemists, backed up by the manifesto of his department against the use of sulphur in the drying of fruit, had stirred up such a hornet's nest about his ears that he was glad to retreat, after promising them no action should be taken against the sulphuring fruit dryers this season at any rate, and with a further promise that he would have a fresh investigation made in order to allow us further leeway in the future. So there we are; this season, at any rate, our fruit men can sulphur as usual, and before another season comes around, it will be discovered that the amount of sulphur deposited in bleaching is not harmful.

Sulphuring does not improve the food quality of fruit. That is generally admitted. But it improves its appearance and without it dried fruit would be sold and a large industry would be killed. But, aside from improving the appearance, sulphur is beneficial in destroying insect eggs which may have been deposited on the fruit in drying, thus preventing the breeding out of worms and maggots, and it also has a preserving effect, so that sulphured fruit will keep much longer than the which is not treated. It may be that sulphur in excess is injurious, but it is very doubtful whether the amount consumed on dried fruit would ever hurt anybody. We do know that in our childhood days we were regularly dosed with sulphur and molasses every spring to cleanse our system and we have survived it, and our children then was a tablespoonful every morning. We'd have to eat a lot of that to get a dose like that. The chemists of the department have made a serious mistake in this case and there is little doubt, in view of the storm of protests which have reached the secretary, that their analysis will be revised.

MORE ABOUT THE WHITE FLY

The White Fly is now being reported from all sections, in fact there is a genuine White Fly scare among the fruit growers of the State and everything that is white, regardless of size or shape is mistaken for this pest. So far, this insect has been discovered in two locations only in the State. At Marysville, where it has gained a very serious foothold, and in Kern county where it appears to be confined to one small tract and not over 100 trees in this have been found to be infested. In both instances the pest has gained entrance through the almost criminal carelessness of people who should have known better, aided by the indifference of the supervisors to the great fruit industry of their counties in the State. In Kern county there has been no system of horticultural inspection for years, no Board of Horticultural Commissioners, and anything could be imported, almost without question, to the detriment of the State. In Yuba county the work of inspection has been carelessly done and neglected altogether. In each case the supervisors have saved the expense of the Commission and have entailed upon their counties a heavy loss, many times greater than the cost would have ever been, thereby jeopardizing the greatest industry of California. But, as stated above, far the White Fly is confined to small areas, and with proper care we can prevent its wider distribution and with hard work and care we possibly extirpate it altogether. It is to be hoped that many of those counties which still object to a County Board of Horticulture will learn a lesson from this and take necessary measures to prevent even a worst pest from gaining admittance.

The California Promotion Committee writes the Cultivator that it will be glad if every Californian will send to the committee the name of friends who are residents of other States and countries, so that the committee may take up correspondence with them and tell them of California's opportunities.

The committee urges that we realize what a glorious State California is and into what a grander commonwealth it is developing with accelerating energy, and letting all the world know about it all the time.

With the Citrus Growers

PRACTICAL SUGGESTION FROM FLORIDA.

WISHING full information as possible from Florida on the White Fly situation, the Cultivator has written growers there. The first reply to reach us from Mr. E. Painter an orange grower, also of the E. O. Painter Fertilizer Co., of Jacksonville, Florida. Mr. Painter says:

Your favor of the 17th in regard to White Fly, duly received and carefully noted. I regret very much to learn that our State is troubled with the White Fly, because I know it is a great deal of anxiety and expense to the orange grower.

Our State has been troubled with this pest for years but we feel, however, that it will soon be under control as the special agents put out by the government and the growers working together have been able to get much information as to the best method of controlling this fly.

Experience has taught us that when the fly is first discovered, that time and money are saved by a considerable expenditure at that time to eradicate and stamp out the fly by defoliating the trees and foliage on every plant on which the White Fly is found and lives. In this State we find the White Fly on the Umbrella or China tree, privet hedge, jessamine and many plants that grow in the woods.

Last year the White Fly appeared in the DeLand section and an organization was at once formed among the orange growers. A committee was appointed and labor hired and whenever White Flies appeared the committee was authorized to defoliate or do whatever was necessary to thoroughly eradicate the fly. The work was so thoroughly done that the White Fly has not reappeared and the growers are congratulating themselves on the small expense they were put to, to stamp out the fly. I owned a grove in that section and I think my expenses amounted to about \$7 including my membership in the society. The extent of my grove was five acres, so you can see I got off very lightly.

Where the White Fly has taken possession of a grove, sprays of different kinds have been adopted. So far the White Fly Destroyer has given good results and also Whale Oil soap. Unfortunately, however, neither of these washes seem to kill all the eggs, consequently repeated spraying have to be done.

The only thing that is relieving the anxiety of the orange growers in regard to the White Fly is that during the last few years a fungus has developed that lives on the White Fly and the larvae, so as soon as the fly is discovered in a grove the fungus is transplanted there and soon spreads all over the grove. This fungus, however, will not grow in an arid or dry country as it does best close to the sea coast where there is always plenty of moisture.

In view of the fact that the White Fly is still removed some distance from your orange groves, I would suggest that the orange people form an organization or company to eradicate the White Fly in its present stronghold. If the plants and shrubs can be defoliated I would suggest you use for this purpose a spray of Thrip Juice. Instead of using one pint to 1000 parts water, as for insecticide, use two pints to 1000 parts water and this will defoliate the tree, at least it acts that way in this State. Then have the leaves carefully gathered up and burned. You can well understand it is better to burn thousands of leaves and twigs that have no fly on them than to have one leaf with a White Fly on it.

I certainly hope the above will be a help to you and the orange growers, and you cannot be too strong in advocating prompt and heroic treatment among the growers.

First be sure that it is the Aleyrodes citri before you go to any expense. There are other White Fly that are harmless to the orange trees.—E. O. Painter.

THE RAILROAD'S SHARE.

The value of the citrus fruit crop of Southern California for the past season is said to be \$30,000,000—about double the gold yield of the State—and of this vast amount over one-third goes to the railroad companies—principally the S. P. and Santa Fe—for freight charges. Out of the other two-thirds comes the profits of the brokers, packers, shoo manufacturers, hardware dealers, spray manufacturers, pickers, other orchard help, and finally the grower gets what is left. Fortunately the past two years the price of oranges has been high and Mr. Grower has laid aside some money. But whether the price for the fruit is good or bad there is one party to the deal who never loses any season—the railroad. The other fellows that play the game may lose but not the corporation that carries the fruit to market.

The proportion of revenue that the freight carrying lines receive from the apple crop of the Pajaro valley is even larger than that they receive from the citrus crop of the south.—Pajaronian.

YOSEMITE SPECIAL MAP.

A map that will be of interest to lovers of mountain scenery throughout of the country, and to Californians in particular, has recently been completed by the United States Geological Survey in co-operation with the State of California. It embraces the Yosemite valley, that far-famed gem of the Sierra Nevada's, which was made a part of the great Yosemite National Park in March, 1905, and which for many years has been a rendezvous for tourists from all parts of the world.

The area covered by the map comprises scarcely 70 square miles, but the scale (2000 feet to the inch) is so large that the sheet is of unusual proportions—namely, 15 by 30 inches.

Owing to the large scale of the map it depicts the valley with a degree of minuteness that was not possible in any of the earlier and smaller maps. Not only is every wagon road, trail and house shown, as on the regular Geological Survey maps, but every angle and bend in the roads, however slight, every turn or zigzag in the tourist trails, and every structure, down to the smallest cabin or Indian rancheria, is faithfully recorded in its exact location. All the bridges—even the larger culverts—are indicated, and the streams themselves are carefully traced. Those that contain running water all the year round are shown by a continuous blue line; those flowing only intermittently are represented by the conventional dashes and dots.

Like the other maps published by the Survey, the Yosemite Special sheet is for sale. As it is double the size of the regular sheets its price has been fixed at 10 cents, and remittances (in cash or money order) should accompany all orders, which should be addressed to the Director of the United States Geological Survey at Washington, D. C.

MR. TAFT'S PLATFORM.

The candidacy of Secretary Taft for the presidency has been heralded by him in a public address made at Columbus, Ohio.

Roosevelt's radical policies are accepted by him in their entirety. Taft announced himself as in favor of tariff revision, but not until after election.

He is willing, however, to have the national convention pledged for the reduction of duties.

To curb "swollen fortunes," the Secretary advocated both an income and an inheritance tax.

The latter he expounds as a safeguard against piling up colossal fortunes by the few to the immediate injury of the many.

The platform announced will have the effect of solidifying public sentiment in Mr. Taft's candidacy and of making him a most formidable possibility for the Republican nomination.

Against him will doubtless be Mr. Bryan on a platform of tariff reduction and government ownership.

A RECORD BREAKER.

Orange growers in California are bigger men this year than ever before. According to a statement made this week by the Southern Pacific and Santa Fe freight traffic officials the orange season just closed has been the most prosperous in the history of California. Since the season opened last November there has been shipped out of California from Butte County, the San Joaquin Valley and Southern California 28,000 carloads. Prices received have been most favorable, so that the gross returns from all these

shipments aggregate the large amount of \$30,800,000, practically an average of \$1100 per car. Of these \$11,000,000 went to the railroads for freight charges, leaving nearly \$20,000,000 for the shippers and growers. All of the latter is not net, however, because from it must be deducted various expenses in the way of boxing material, commissions, cost of loading and money spent in care of the groves from which the fruit was picked. But even with all these deductions the profits for the season have been larger, both in the northern section of the State and the orange districts south of the Tehachapi than any previous season. In detail the figures run: Cars of oranges shipped 28,000; number of boxes, 10,620,000; number of oranges, 3,276,000,000; gross receipts, \$30,800,000; railroads' share, \$11,000,000; growers' and shippers' share, \$19,800,000.

YOUNG FARMER'S OPPORTUNITY.

A number of years ago, writes a contributor to the Spokesman Review, a middle-aged man was crossing the Atlantic to one of the world's fairs in Europe. He was a harness maker from Canada. Before the voyage was over something or other led him to relate his early experience at his trade. He said it was a long and hard pull for him to accumulate his first thousand dollars. He worked 16 and 18 hours a day in his shop the year through with the exception of a fortnight in the winter, which he devoted to the Canadian sport of curling on the ice. He had finally arrived where he could take life a little easier and was combining business with pleasure on his transatlantic tour.

The other day a farmer remarked that his income, after paying his expenses of the farm and not including his living—that is to say, his net income—was about \$700 or \$800 a year. He added, significantly also, that he was out of debt. He has only 25 acres of land and of this only 15 are under cultivation. Out of thousands of clerks and even business and professional men in town how many can count on laying by \$700 or \$800 in cash every year?

But to return to the farmer with the 25 acres. This man started out 14 years ago without any cash to speak of, and before he began to arrive on Easy street he had a hard pull during a series of years. Like the Canadian harness maker, the first thousand dollars came exceedingly slow. Both, however, hung to it like grim death until success was achieved. There can be no better definition than that of the young man who by patience, industry and intelligence through the years of early manhood becomes established in a business or profession which yields him a good living and nets him an income which he lays by for future contingencies.

The Canadian harness maker, the farmer of a few acres, the professional or business man in town—all are on the same footing when it comes to working out the problem of success. The same traits are necessary in each, the same patience.

Away back in a New England village there lived a fatherless boy, who, exceedingly early in life, was obliged to aid in the support of the mother and younger sisters. He found employment with a hard-headed and stony-hearted descendant of the Puritans. His young life was anything but one of pleasure. Somehow or other a good angel whispered in his ear the old-time phrase, "to labor and to wait." When this young man had attained success in his chosen vocation he remarked one day that "all through those years of long hours and unremunerative work he was constantly saying to himself 'to labor and to wait.'"

Any young former who is willing to labor and to wait, applying himself industriously, keeping his brain as well as his body active, is on the road to success. Such a young man will find no time to lament his condition, to bewail the times, to rant about the rich and the poor; for his eye is fixed on the mark of the prize before him.

The Year Book of the United States Department of Agriculture is probably the most popular government publication printed today. It contains articles on all phases of agriculture. These articles are prepared by men from all sections of the United States. There are more copies of this book printed by the government than there are of any other publication and it can be obtained free of charge by addressing any of our members in Congress from this State.

BIG MEN IN CONFERENCE.

One of the most important assemblies of the year is that at Sacramento this week where leading men of the country are discussing irrigation in all its varied branches.

Certainly no subject is more vital to the State of California than this. Water is king here and its subjects are the fertile lands and every citizen of the commonwealth. That we are only in our infancy, as regards the possibilities of the State, when irrigation is reduced to a science is plain to be seen. We are destined to be the leading agricultural State west of the Mississippi. All we need is an intelligent scientific basis to build on and our wondrous climate and inexhaustible soil will accomplish the rest.

The gathering of the splendid representatives of the irrigation interests of the country, at Sacramento, cannot fail to be productive of results which will be beneficial to the Pacific Coast, and to California in particular. As Mr. Gifford Pinchot, Chief Forester of the United States, says: "We can scarcely estimate the value of California when our mountain sides are covered with forest trees which will increase our rainfall in volume and regularity."

The precipitation will not all rush down through the trees from the bare rocks, but a dense undergrowth sure to spring up under the trees, the water will be caught and held, work its way slowly all the year along into the streams. This will give a larger volume of water for irrigation in the summer, making the intensification of more land possible. Plains now barren will be converted into orchards; foothill slopes now useless for lack of water will become the most beautiful and fertile lands of all. The restored forest, once in vigor, will work its way by degrees down the mountain slope until the whole is converted into beautiful woodland.

The Owens river project will do much to solve the problem of water in Southern California. It will convert hundreds of thousands of acres of arid lands into garden spots of beauty and add untold millions to our wealth in agricultural production.

The National Irrigation Congress was invited to California says the Deseret Farmer, because of the strongest interest taken here in irrigation, development, and it is expected to give a needed impetus to irrigation building." Because of this interest in the objects, as well as from motives of hospitality and State pride, the people of California have prepared a splendid reception for delegates and will expend upwards of \$50,000 in making this the greatest irrigation celebration in history.

THE GREAT VALLEY OF CALIFORNIA.

Continued from First Page

quantities of debris washed down from the gold mines of the adjacent mountains during the period when hydraulic mining was unrestricted.

There is no thought of building this great project with the present National Reclamation Fund. The most that can be done is to make a beginning which is being done at Orland on the west side of the Sacramento valley; the sum of \$650,000 has been set aside for the construction of a small unit, comprising only 20,000 acres, a very small area compared with other projects in process of construction, but immensely important as the beginning point of the greatest of all irrigation enterprises.

A feature of this development in California will be the tremendous ultimate possibilities from the standpoint of population. The Semi-tropical climate admits of the cultivation of the most tender and consequently the most valuable plants and adds immensely to the production of crops which lend themselves to continuous growth. Small areas are sufficient for the support of large numbers, for this valley, from the northernmost to the southernmost limit, is the land of the orange, the olive and the fig.

The National Irrigation Congress was invited to California because of the strong interest taken here in irrigation development, and it is expected to give a decided impetus to irrigation building. Because of this interest in the objects, as well as from motives of hospitality and State pride, the people of California have prepared a splendid reception for delegates and will expend upwards of \$50,000 in making this the greatest irrigation celebration in history.

W. A. BEARD.

Agricultural Notes of the Pacific Coast

California

SOUTHERN.

Riverside's vineyards are holding their harvest.

Cars of peaches will be the first shipped from Hemet this season.

Peaches in the Imperial valley will ripen much earlier than usual this year.

Arlington Heights Fruit Association is the largest individual packer of peaches in California.

Riverside county has 19,900 acres of peaches, according to figures published by the Riverside Press.

Corona melon grower is coming over the size of his melons. He says that he cannot find one in the valley less than 32 pounds.

Imperial valley finds it has received more for its melon crop than any other during the season. Total receipts over one-third of a million dollars.

Is in the Palos Verdes hills near San Pedro, caused so much trouble that navigation in and out of the harbor and at Redondo was interrupted with.

Wiley is somewhat swelled up with the fact that her melons were sold to the mines in Klondike county and other far Northwestern states this year.

One acre of Cornichion grapes at Hemet this season nets the grower \$2.50 per acre. Who says that government inspectors in the Imperial valley is not \$2.50 per acre.

Boys at Riverside were caught stealing watermelons, who had also stolen many other melons in the valley and were given 60 days in the jail for their escapade.

Imperial valley farmers sow their seed in October and November, then about a foot high, pasture it and make it stool out and give better hay and grain crops.

Gun clubs which have been in the habit of wasting water for the purpose of ponds for wild duck, are now concerned over the new law regarding the wasting of water.

Spud crop in the Hemet valley is about one-half a stand for an unknown reason. The seed did not grow well. There is an excellent crop of peaches, peanuts and sweet corn.

Combined harvester and threshing machine at Hemet are about through and the yield was above an average. Haymen are still very busy and the hay crop while not so large, is better in quality than usual.

Box making machine manufactured by the Riverside Foundry and Machine Works, is attracting much attention as being one of the most ingenious orange-box-making machines yet manufactured.

Fruit growers of Orange county filed a complaint with the Interstate Commerce Commission regarding the rate which has prevailed for celery. This has been brought about by the recent advance in rate.

Profitableness of melon and the garden truck is appealing to growers more this year than formerly. A new association is being organized at the city of Imperial for encouraging further productions along these lines.

CENTRAL.

Watsonville has nine apple drying plants.

Santa Clara apple crop will be one-half of the average.

There are twelve thousand automobiles in California.

Drying of Muscats in the raisin section is now well under way.

Farmers began delivering beets at the Spreckle's factory on August 20.

Hanford Sentinel reports large output of fine wheat for that section.

Prof. Stubenrauch investigated fruit conditions in Pajaro valley last week.

Dried Zinfandels are bringing three to three and one-half cents per pound at Fresno.

Salinas City claims distinction because of her city orchards and flower gardens.

The Pajaro valley apple crop is freer from the codling moth than for many years.

Visalia Times is making a campaign for use of local manufactured sugar by home people.

The acreage of beets at Salinas is less than formerly, but the average crop per acre is greater.

One shipper forwarded four carloads of Bellefleurs and one of pears last week from Watsonville.

Plans are on foot in Watsonville to protect the lower portions of that section from winter floods.

A great celebration was held in Corcoran this week over the laying of the corner stone of the sugar factory.

The County Entomologist of Monterey reports the prevalence of codling moth to a greater extent than usual.

The weather observers station at San Jose is to be greatly improved by new instruments and appliances.

Big new steam plows have arrived in King City to be in readiness for turning the land for beet growing next season.

Fresno sheep herders convicted of having purposely started a destructive fire near Bakersfield were fined only \$25 apiece.

The Poultry Keepers' Union of San Benito county has a membership of sixty-two. It was organized for commercial purposes.

Fresno is making great preparations for her raisin festival next week. It will be held three days, September 9th, 10th and 11th.

Watsonville has a new apple. It is a hybrid of the Bellefleur and Siberian crab. It is said to be exquisite in coloring and quality.

San Joaquin county has eighteen thousand acres of potatoes. Some plantings yielding as high as three hundred bushels per acre.

Well's Fargo Express Company has inaugurated special express service between San Francisco and Los Angeles, with special refrigerator cars.

The Fresno Republican is making some trip-hammer blows against J. K. Armsby Company which it maintains is endeavoring to bear the raisin market.

Fresno grape growers are drying Zinfandels for shipment to France to be made into wine. It is claimed this gives better returns than local winery men are paying.

NORTHERN.

Three wineries are in full action on this season's vintage at Cordelia.

The first shipment of Tokay grapes from Wheatland was made August 10.

Mendocino county's pear growers have sold their crops at about \$35 per ton.

A carload a day of Thompson seedless grapes is shipped from Yuba city.

Twenty tons of prunes to the acre is the claim of an orchardist near Yuba city.

Ukiah pear crop will be about one hundred and thirty tons, about one-half of last year's output.

Enormous growth and unusual size of grapes is the report regarding Muscatells in Sutter county.

Twenty thousand visitors are expected at the great Irrigation Congress at Sacramento this week.

A new town is to be established near Lodi, to be known as Tokay. It will probably be painted red.

Great quantities of money are being withdrawn from the San Francisco banks for the purpose of moving the crops.

Dried peaches are quoted much better than for some time, and it is thought the sulphur scare is over for this season.

Twelve dollars a ton for wine grapes delivered at the winery is the price fixed by the California Wine Association.

A special train took over one thousand and San Francisco people as pickers to the Wheatland hop lands for the picking season.

Some California shippers of dried fruits are giving guarantees of protection against federal prosecution of sulphured goods.

Healdsburg Enterprise claims many resistant vines will be planted in Contra Costa, San Mateo, Napa and Sonoma counties this season.

Glenn county boasts a thirty-six acre rice plantation. It is the property of the Sacramento Valley Land Company and is on the Glenn grant.

A force of workers under the direction of the State Horticultural Commission, has practically finished fumigating all the White Fly infested.

The Fair Oaks Fruit Company has closed a contract for nearly all the olives in the vicinity. Price paid was \$40 for oil olives, to \$60 and \$80 for pickling olives. It is the finest crop ever in that section.

An output of dried apricots of the Vacaville section, comprising Vacaville, Suisun and Winters will be about four thousand dried tons, which at average prices, it is estimated, will bring to that community one-half million dollars.

Nevada county reports its fruit crop much short of last year, one extreme case being that of one grower who shipped two thousand boxes of apples last year, and this year his apple output was only fifty.

Standing on the summit of a certain hill in Petaluma township one can count hen houses enough, allowing one hundred chickens to each, to shelter over one hundred thousand fowls. There are easily a million hens in that township alone.—Courier.

Miscellaneous

Athena, Ore., is asking for a new creamery.

Wheat is practically all cut about Wala Wala, Wash.

Freewater, Ore., observed "peach day" on August 28th.

A plan is on foot to hold an Interstate Fair at Spokane.

Oregon prune-growers are in the midst of prune drying.

An Alaskan potato grower claims to produce a vineless potato.

Wala Wala, Wash., cannery is just beginning on the tomato pack.

Wheat shippers of Washington are alarmed at the great car shortage.

Western Montana had as early as August 20 a serious nipping frost.

Spotted fever and influenza prevail among the horses of Creston, Wash.

Washington yield of wheat will reach 41,000,000 of bushels this year.

Horses effected with glanders at Sprague, Wash., have been slaughtered.

Portland wheat buyers are snapping up all offers of wheat at top quotations.

The fruit outlook of the Freewater, Ore., district is claimed to be the finest ever.

The first shipment of honey in many weeks was received in Spokane a few days ago.

A heavy frost near Pullman, Wash., nipped many tender vegetables and did much injury.

Large plantings of fruit trees are to be made in the Rogue river valley in the coming season.

A new veterinary hospital is being constructed at the Washington State College at Pullman.

The cannery at Milton, Ore., has closed for want of funds to conduct the season's business.

The wheat crop of Washington exceeds the highest yield of other years by over four million bushels.

Farmers about Athena, Ore., are pooling fruit interests and demanding bids on the entire output of grain.

Washington creamery butter now quoted at thirty-six cents a pound is prophesied to reach fifty cents.

Seventy-three and one-half bushels club wheat to the acre is the phenomenal yield reported by a rancher near Wala Wala.

Washington farmers have suffered much loss from the early rains which have been followed by much warm and bright weather.

New warehouses are being built about Palouse and other eastern Washington points for containing the great output of wheat.

An average yield of about forty bushels of wheat to the acre for five hundred acres is the record of one rancher near Pullman, Wash.

A fruit-grower on the Twisp river who practices irrigation has succeeded in raising an immense crop of strawberries during the past season.

The experiments taken up by the Experiment Station at Corvallis on the improvement of winter wheat have resulted in vastly increased yields.

A fair crop of apples for the Willamette valley for which the Eastern demand at a fine price is made. The output will be about four hundred carloads.

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet, "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

FINE POULTRY YARDS.

ABOUT a mile north of the city limits of the beautiful city of Pasadena, is located the unique bachelor hall and poultry ranch of Carl C. Curtis.

Here the visitor always finds a "glad hand" and Mr. Curtis, happy and content with his White Leghorns, Pheasants, Duroc Jersey hogs, Russian Wolf hounds and his beautiful pure bred Arabian horse.

Never Got Bit.

Here we found about 500 old birds and over 1800 of young stock; as we approached Mr. Curtis' home we were somewhat anxious and on the lookout, for we knew that Mr. Curtis not only bred Leghorns but that he was a lover and breeder of the Russian Wolf hound. Knowing that he had a number of these wonderful dogs on the ranch we were somewhat timid, but discovered that we had no grounds for fear as the dogs are very kind, and that they were confined in a strong wire cage.

We visited the incubator house where we found Mr. Curtis preparing his eggs for market; after this was finished he proceeded to show us over the ranch. We first stopped at the brooder house; although not in use at this season of the year we found many interesting, convenient and practical features.

Method of Heating.

One very interesting thing to us and one that we had been wanting to see and look into was the plan of heating with acetylene gas. Mr. Curtis heats and lights his entire plant, barn and house with acetylene gas and finds it as cheap as oil and a great deal better. It saves much work in cleaning and filling lamps for incubators and brooders. Besides being more convenient, acetylene gives a more even heat, and affords the advantage of having a light in any place desired.

The brooders or hovers are the style originated and used by Captain Mitchell and are what are known as the overhead system of heating. The floor of the brooder house and all poultry houses are cement; on this is sprinkled a thin coating of fine sand, which is sifted clean of droppings when houses are cleaned.

Yards and Houses.

Mr. Curtis uses the colony house. All houses and runs are the same size being situated with alley running entire length of ranch giving access from alley to any yard, also ability to go from one yard to another. In each yard, which is 20x140 feet, is a house 8x16 feet, the quarters for 45 birds. This gives plenty of room, as the birds are only in the house at night. All yards are the same size and contain the same number of birds excepting one, which is 40x140 feet with house 18x28. In this were 80 two-year-old hens with a record for the first year of 180 eggs each.

Dry Food vs. Mash.

In an experiment made by Mr. Curtis with two lots of hens of 60 each, one fed on a dry food, the other on a mash; he got an average of 150 eggs, but the birds fed on the dry food cost

three and one-third cents per hen per month, or 40 cents per year more than those fed on a mash.

Here is a problem for the dry man to figure out. We know that takes more care and labor to feed mash than to feed dry food in hens, but does it take 40 cents a bird more? Personally, we made the comparison as to the cost of the two foods, but have heard said that birds fed on a dry food in a hopper will eat more than when the regular way. For a feed of Mr. Curtis feeds 35 pounds to his hens.

Breeding Stock.

In all nearly 2500 birds we did find a sick bird, but found birds that would score up well as be an honor to any show, and hope the coming season will find Mr. Curtis in the show room. We pens of birds that had a record 250 eggs per hen, and was told by Mr. Curtis that no eggs were set or for hatching that were not from hens that had made a record of eggs. He expects to raise the record soon by keeping only hens that had better average than this. Anybody buying stock or eggs from him feel that they are not only getting fancy stock, but birds that are for utility as well.

AROUND THE YARDS.

Keep the young stock growing

A hen returns the greatest profit up to the time she is two years old.

Yard your birds early so they may get accustomed to their new quarters and ready for lodging.

Rooster—Talk about your pedigree stock, huh! Well, my father was \$500 rooster and my mother was \$49 incubator. How's that for ancestors?

Yard-raised poultry are preferred to farm-raised by epicures. The first is more tender and juicy.

Keep for maturity only the best of the whole lot of pullets.

Mites on Pigeons.

Please tell me through your paper how I can destroy mites on pigeons.—Mrs. H. K.

Clean up your lofts and nest with whitewash and spray with kerosene emulsion. In this way you can get rid of the mites as they will not stay on the birds.

The poultrymen around Anaheim are talking of starting an association so as to buy their feed in large lots and also cheaper. We want to get in to communication with some association that is doing the same.—J. A. B.

Petaluma has the kind of an organization you speak of. We would suggest that you write to the Petaluma Chamber of Commerce for information you desire.

Pigeon Feed.

Please tell me through the column of your paper what shall I feed mated pigeons? As I have gotten some lately.—Fletcher Chapman.

Feed your pigeons wheat and Kaffir corn and a good chick food. Give plenty of fine grit, and water for them to bathe in.

CARBOLIC ACID FOR MITES.

Think the rule to give and take good one, and as I have taken a deal in the way of help from experience I ought to give a hat may help them. There are who want a remedy for mites ce. Mites don't stay on the they are only on them at night they are on the roosts, or when re on the nests to lay. Use carbollic acid and kerosene to the under side of roosts and the ends where they rest on reports. Don't put it on the top unless care is taken that it ple time to become thor-dry before the hens go to Have the carbollic and kero-ow into all cracks and crevices the pests may hide. It is sure to them if it touches them.

the roost poles so you can em out of the sockets they rest have the acid and oil flow ll cracks. That is where they I bought a hen of a man and to get her at night. She was overed with mites and I got my stocked with them. I cleaned

another occurs in from ten to more hours. In some cases the disease runs a rapid course, in other cases longer.

Examination after death finds the liver enlarged, very large in some cases and very dark, sometimes a dark green, sometimes spotted. Its gall bladder is mostly distended with a thick, discolored bile. Its rectum and intestine are congested. When attacked a bird rapidly loses weight. Literally the flesh seems to shrink, shrivel and disappear into the air.

The germ under the microscope shows up in form both oval and round. Its deadliest effect is felt between a temperature of 85 and 100 and over. Damp, hot water is best. It cannot move of its own accord, as some other form of germs do. And it is easily killed, will die out of itself when dried; has weak resistive power and can be easily killed by disinfectants, such as carbollic, bonzoic, salicylic or sulphuric acids. By playing a spray of hot water on infected spots for ten or fifteen minutes, the germs are killed. One per cent solutions of the above acids will utterly

Residence and Yards of Carl C. Curtis, North Pasadena

destroy it. But some substances deadly to other germs in a certain per cent solution, will not kill the cholera germ, such as alcohol, iodine, potassium, etc.

The value of disinfection in the disease goes without saying. Kill off and burn the sick fowls, then disinfect, is the remedy. Germs must pass into the stomach or get into an abraded place on the fowl to cause the disease. It is brought on the place usually by other fowls or wild birds; or the disease germs, yet rife in the soil, are carried on the feet of dogs or cats to the yards. Fowls are now, in certain localities, inoculated against death by cholera. The virus inoculated from sheep, horses or man forms an abscess where the virus entered, but shows no other symptom and does no harm, but some of the smaller animals it immediately kills. In passing from the sick to the well fowls, be very careful that you do not carry some of the virus on your hands or clothes to the fowls not yet inoculated.—Coleman's Rural World.

Worms often affect fowls, and result from filthy houses and runs. They do not cause death in every case, but are a detestation to those having large flocks. The best remedy is sulphur, a tablespoonful of which should be given once a day, for two weeks, in dry weather to a dozen or fifteen fowls. Twice a week a teaspoonful of spirits of turpentine mixed with a quart of cornmeal, moistened, should be allowed, all other foods being withheld for twenty-four hours. Air-slaked lime may also be used freely and with advantage over the floors of the houses and yards. Spade up the yard, give the premises a thorough whitewashing and burn up the old roosts and nests. Give a thorough cleaning out, rid the hens of the worms and keep the premises clean and there will be but little danger of the fowls having the same trouble again.

Egg-More for Early Molt

Don't let your hens molt for months. Don't let them get all run down and out of condition. They need to be fed a scientifically balanced ration during this trying season. EGG-MORE is just the thing to mix with good grains to make the same a rightly balanced ration. Many so-called "poultry foods" and "egg makers" are nothing but stimulants and not advisable to be fed regularly. If your poultry are already in a run down condition,

West Coast Poultry Tonic

is what they need for a short time; that is just what its name implies. It is very easy to mix a lot of ingredients, much of it a little better than refuse and call it egg food. And even if good foods are mixed it doesn't make an egg food unless the ingredients are adapted to the requirements. Some mixers of "egg food" seem to think that it is the shell alone that is to be made, forgetting that the hen has no use for the shell until she has made the egg.

Egg-More

is a concentrated food, very rich in protein, and a small quantity mixed with ground grains, or even with bran, is just what is needed to make her molt quickly and then lay lots of eggs. It is made of just such first-class materials and in such proportions as has been proven by long practical experience to serve this purpose, and at the same time to build up her system and keep her in the best of health. When a small quantity is mixed with good grains, or bran, as directed in each package, it can be fed either as a mash or as dry feed. The hens like it, they eat it, there is no waste; it makes the cheapest egg food that can be made, especially if you can buy your grains at home cheaper than to ship them in.

EGG-MORE is put up in 4-lb. packages at 35c; 25-lb. pails, \$2.00; 50-lb. sacks, \$3.75; and is for sale by many dealers. If yours doesn't keep it, or will not get it for you, we will deliver a pail or sack, freight prepaid by us.

Silver's Clover Cutter For Poultry

This machine will cut clover, alfalfa, straw, vegetable tops and similar material, green or dry, into $\frac{1}{2}$ inch lengths, which makes it especially adapted to cutting feed for poultry. It is all iron and steel, consequently very durable. Length over all, 24 inches. Size of feed box, 18 inches long by 10 inches wide at rear end, by 8 inches at throat. Feed rollers are full width of cutting surface. Has 8-inch, 4-bladed, solid center, spiral knife, with adjustable cutter-bar, like a lawn mower. Capacity is a bushel of cut clover in 10 minutes or less. It is intended to be mounted on a bench or box to make it right height for operator.

BUYING EGGS BY WEIGHT.

There can be no doubt that if the were universally adopted it would have a more speedy and far reaching effect in the improvement of the poultry industry than any other reform that could be introduced. Practical poultry keepers know that they can produce eggs of very fine size and quality by giving due attention to the breeding, selection, care and management of poultry. It is worth while to do this when the result is an increased price for the eggs and it does not cost any more to produce large eggs than small ones.

Now to prove this to the ordinary farmer who, in his heart, has nearly a contempt for the proceeds of the poultry yard, I will give some figures showing the benefits of buying and selling eggs by weight. These figures have been given me by the managers of the poultry societies in Ireland, which has adopted this system. Of the eggs purchased by one society three years ago, 40 per cent weighed $13\frac{1}{2}$ pounds per 120; 40 per cent weighed 15 pounds per 120 and 20 per cent weighed 17 pounds per 120. There were no eggs capable of being graded as 18-pound eggs. At the present time, of the eggs purchased by this same society, 10 per cent weigh $13\frac{1}{2}$ pounds, 30 per cent weigh 15 pounds, 30 per cent weigh 16 pounds, 20 per cent weigh 17 pounds and 10 per cent weigh 18 pounds per 120. It must be regarded as an extraordinary improvement, consider-

ing the short period in which it has taken place.

Now in regard to the other society, where the time has been longer, the increase in the weight of the eggs is far greater and a few quotations will suffice to illustrate the benefits that accrue from the system of buying and selling eggs by weight. Four years ago 50 per cent weighed $13\frac{1}{2}$ pounds, 30 per cent weighed 15 pounds and 20 per cent weighed 17 pounds per 120. At the present time 30 per cent weigh 14 pounds, 30 per cent weigh 16 pounds, 20 per cent weigh 17 pounds and 20 per cent weigh 18 pounds per 120.

It may be noted that this society has eliminated the $13\frac{1}{2}$ -pound eggs. The smallest are now 14-pound eggs, and there are only 30 per cent of these, as compared with 50 per cent of $13\frac{1}{2}$ -pound eggs four years ago. The 15-pound selection has also dropped out and its place has been taken by the 16-pound eggs, while there are 20 per cent of a new selection, namely, the 18-pound eggs.

If this is not proof positive that the buying and selling of eggs by weight leads to the improvement of the poultry industry, I fail to see what it is.—Farmers' Review.

A PURE-BRED ARGUMENT.

Why is the pure bred fowl better than the mongrel? The reasons are many: For one, you can always depend on the pure bred for uniform growth. Take a mongrel hen and her chickens will vary. They never grow fast, and one or two in the bunch will be ready for market two months before the others. Not only that; the pure bred are uniform in looks after dressing and sell higher on this account for breeding and themselves always sell higher than the market price, too. Persons raising the pure breeds exclusively in this country must keep all their eggs from early spring until the hatching of the eggs; and now, since incubators are so useful and common, those who want eggs often order many weeks ahead to get all they need. Another reason is that the mongrel hen averages at the best about forty eggs per year. The pure bred laying breeds, with worse care given, will lay over a hundred eggs, and with moderate attention I have known them to lay very close to two hundred eggs per year.

What is needed is to bring our pure breeds up to the highest type of hardiness, utility and beauty, and then for the poultry farmer to use only fowls that are strictly pure in blood. Until then poultry raising will be more or less an uncertainty. When good blood is used, we see success in all branches of live stock. Blood is the foundation of success. In all the established businesses the best is what must be secured for foundation. Mongrel hens may answer some owners, but the best is the cheapest in the long run, and those who would prosper in the future poultry business must produce the best for breeding. As a rule, you can not buy a breeder's best birds—unless he raises them in large numbers and has more good birds than he needs for his own breeding pens—birds fully as good as he has selected for his own use. If he is an honest breeder, you can buy eggs for hatching from his best pens, and the chances are you can raise birds just as good as his best at a small cost. Start right by saving only the best eggs from the selected hens for incubation, the most prolific layers.—Rural Home.

Makes harness proof against heat and moisture. Gives a glossy black finish. Prevents rot, imparts pliability, strength and durability to leather. Saves bills and mishaps. WOMEN AND POULTRY.

Now that so many ladies are turning up poultry keeping as a fad, the farmer's wife will have to look for laurels. With all the advantages seemingly on her side, the city poultry breeder often fails to set a good record for the number of birds kept as the city breeder. This is usually due to the fact that she does not know her limits. The city breeder knows that if she raises more chickens than she can comfortably care for in her own yard, she will hear from her neighbors. She has learned the limits of her poultry keeping, and stops at that. With milk and cream to see to, no time to do, and no fruit to gather in the garden to tend, the city fancier has more time for her chickens, cares for them better care, and when it comes to the poultry shows, the back yard fancier carries off a good share of prizes.

The country fancier often has too much dependence on the range. A hungry horde of chickens soon exhausts the ordinary range of food. We all know that the range is good, or at least feed to the growing stock. But when the chicken's crops at night when they come off the range. If they come at the call for supper it is because that feed is not needed, but when they are hungry give them something to eat. Every fowl on the range should go to bed with a full crop. Don't turn the valuable first hatched chickens out without shelter. Trees are all right if the fowls will use them. Anything is better than over-crowded coops. Fresh air, plenty of feed, and plenty of room with protection from rain, will produce the finest of farm poultry.—Washington Farmer.

Bees and Their Care

NEEDS OF BEEKEEPERS.

THE following extracts from a letter written this office by Ralph Benton, Assistant Entomologist of the State University, while written for publication has points of interest for beemen.

I have been looking over with pleasure the last issue, (Aug. 22nd) of the California Cultivator, just received by me. As a subscriber to the "Far Western Bee Keeper" the arrangement is acceptable to me, in view of the discontinuance of that publication. I was somewhat disappointed when after a long conference with Mr. Horn at Riverside, it was concluded the wisest plan was to discontinue, at least for the present, the publication in question. I am disappointed because I believe there is a place for good bee literature among the beekeepers of California. I am sure there are good Eastern publications, The American Bee Journal, Gleanings in Bee Culture, The Beekeepers' Review and others, but none of these journals cover adequately the things of local interest.

I was much impressed during my recent three-month's tour of the State, with the many needs of the average beekeeper. Foremost among these is the educational work. While we cannot reach in our institute work a large number of these needy people in the sphere there is necessarily reached. We must needs depend more on the printed page. We have one more bulletin underway at the Experimental Station and we are in hopes that these may be of some use. We believe, however, that there is nothing better than an up-to-date bi-weekly or weekly publication to reach the average beekeeper. The next best thing is a well conducted department in an agricultural or horticultural paper. I speak of these things to let you know our position in regard to the work you are doing.

There is no reason why this page of the Cultivator may not be the means of conveying much information and be an aid in extending this industry in this State. Ordinarily this department has appeared bi-weekly. Maybe the department will be that it shall appear more often. Beekeepers are just closing a rather disappointing season. Possibly at this time they may not be inclined to encourage extension, but I hope none too soon to talk over next season's campaign.

Make the Cultivator the platform on which to talk. It will reach thousands (12,000 copies are sent out each week) and if we put up an interesting talk and show the advancement of this industry, who can estimate the extent of the influence.

Some who now have no inclination toward beekeeping may become interested and become a strong support of the industry. It's a big aim, isn't it, let's talk of the industry.

Let's talk amongst ourselves, if there is any need, or information wanted, let's query and the Cultivator will get an answer if possible.

HOW TO MAKE AND WEAR THEM.

I doubt the wisdom of going among a large lot of bees without wearing a veil. In a very hot day it is decidedly uncomfortable to have a colored sort of feeling that a veil and I may not have my veil but I want it ready to pull

down at a moment's warning. To the beginner there's a sort of fascination about the idea of being able to say: "I never wear a veil," and even some of experience take pride in going without one when they might do better with one.

One objection to going without a veil has, perhaps, never presented itself to many. It is that the absence of a veil is hard on the bees. Before reading any further, stop and think whether you can give the reason why. Give it up? Well, I'll tell you. If you wear no veil, it's practically certain that you'll use a good deal more smoke than you otherwise would, and I don't believe bees enjoy having a lot of smoke blown into their eyes any more than you do.

Possible to Work Without.

I think I hear some one reply, "But I can work at bees without either veil or smoke." So can I; and I think it's a good way for the amateur who keeps bees for the fun of it, and has time to burn while playing with them. Indeed, I think if I should live to be an old man, with nothing else to do, I should thoroughly enjoy sitting at a hive by the hour, watching the bees at work, and manipulating their combs with such gentleness and deliberation that they would have no inclination to sting me, withdrawing from them if, on account of weather or for any other reason, they made any protest against being handled without smoke or veil. But for one who is working his bees for the money that's in it, and wants to slam through a certain amount of work in a day, whether the bees are kind or cross, it's too expensive business to move so gently that the bees think you're not moving at all.

There may come a day when we have bees so gentle and so industrious that they will store more than any bees we now have, and at the same time need neither veil or smoke under the swiftest manipulation, but that will probably be some time after next week. For the present, barring amateurs, all beekeepers need veils, with the exception of the man in the city close to neighbors and he ought to be obliged to do without a veil—at least a good many of him.

How to Make.

Of all the veils I have tried, I like none better than the plain bag open at both ends. Get bobinet, which goes also under the name of cape net or lace net, and is about 21 inches wide. It must be black if you care to preserve your eyes, also if you care to see clearly. Soak in hot water to take out the starch. Cut a piece as long as, or a little longer, than the circumference of your hat rim. Sew the two ends together and make a hem at each end of your open bag, through which you will run a rubber cord. The upper cord will hug the hat at the place of the hat-band. For a permanent hat and veil, it is better, instead of the rubber cord at the top, to sew the veil to the hat at the outer edge of the brim and under it. It is also better to sew a piece of white material at the bottom to make the lower hem, as the black material crows the clothes.

Cross bees, when making an attack, fly in a horizontal line, so they do not often get under the veil, even if the rubber cord does not hold very close about the neck.—Gleanings in Bee Culture.

Home Jobs

There are a thousand little things to be done about the house and farm that you are called upon to do yourself if they are done at all. To do them rightly and easily you require good tools—better tools, indeed, than the carpenter, because he has the means of sharpening, setting, and adjusting, which you have not.

For the home, the shop, or the farm, there are no tools equal in any respect to

KEEN KUTTER

Tools and Cutlery

The Keen Kutter trademark on the tools guarantees your money back if the tool is not exactly right.

Keen Kutter Tools include Carpenter's Tools, and a full line of Farm and Garden Tools—Forks, Hoes, Trowels, Scythes, Manure-hooks, Lawn-mowers, Grass-shears, Rakes, etc. Also Scissors and Shears, Pocket-knives and Table Cutlery.

Keen Kutter Tools have been sold for nearly 40 years under this mark and motto:

SIMMONS HARDWARE COMPANY (INC.), ST. LOUIS AND NEW YORK, U. S. A.

This is Where the Hard Work is Done

and this is where some spreaders give you trouble. It's easy enough to build the front end of a spreader—the front end is a wagon; the back end is a machine.

In SUCCESS Manure Spreaders

28 years' experience insures no trouble at the business end. Twenty-eight years has eliminated the trouble-making things.

We tried gear drives—they won't do. We saved you the trouble of trying them.

We tried smaller axles—they won't stand the strain.

We tried all woods for the frame and have settled on second-growth white ash.

Look at that cut again—See the heavy iron brace from the beater end to the driving axle. It removes all strain from the end of the body and makes the cylinder run freely without binding.

See the big driving wheel and the chain—that's a steel-pin chain—the only kind that will work satisfactorily.

KEMP & BURPEE MFG. CO., Syracuse, N. Y.

DEERE IMPLEMENT CO., San Francisco, Cal., Pacific Coast Agents.

We can't begin to tell you in an advertisement all the good points in SUCCESS Spreaders, but when you get ready to buy a spreader do three things.

First—Write for our spreader book. It tells plainly and truthfully about SUCCESS Spreaders. It will start you right in the selection of a spreader. It will be a standard to guide you in examining others.

Second—When we send the catalog we tell you who sells SUCCESS Spreaders in your locality. Go to that dealer and see one. Examine it thoroughly. Compare it with others.

Third—And most important of all—Go to some man who has used a SUCCESS for a few years and ask him what he thinks of it.

Do this and you will have Success with your manure spreading.

**Are all your buildings
covered with roofs that won't
leak?**

Not if you have tin (which rusts); shingles (which warp and rot); slate (which breaks); or tar (which dries-out and cracks).

Gen-as-co Ready Roofing is Trinidad Lake Asphalt, the natural water-proofer that you know will never leak.

For every building on the farm, from house to chicken-coop, Gen-as-co is the most economical and satisfactory roofing.

Easy directions for applying with every roll; also nails and cement. Ask any progressive dealer near you. Don't take a substitute.

Write for the reasons—Book 35 and samples.

Queries and Replies

Questions to be answered in this department should be received at this office a week before reply is expected. Write plainly on one side of the paper and full name and address. Unsigned communications receive no attention.—Ed

Hop Yards.

Please tell me where are the most extensive hop yards, and when does picking begin, and what price is paid?—R. M. B., Ramona.

There are no extensive hop yards within several hundred miles of you most of them being in the northern part of the State. We do not know the general price of picking, but note that at Ukiah the pickers who stay by the yard for the season are paid \$1 per hundred, while those who pick only through the flush season are paid 75 cents.

As to Budding.

In your issue of Aug. 22, is an article headed, "Budding." We want to learn more of pruning. Please give us the mail office of W. Paddock. We infer that the fruit on a limb, not from the introduced bud, must be inferior. How shall the pruner keep the tree free from limbs which have not been improved? Suppose the bud set into the north side of the tree. How is the pruner to learn which of the branches on the north side of tree is from the valuable bud? And when he has learned that, must he remove all branches which cannot be traced back to that planted bud?

If there are other folks as ignorant as we, an article on pruning budded trees and fruit trees in general, would be appreciated.—D. C. DeVin.

Mr. Paddock's address is Fort Collins, Colorado. Either visit a nurseryman or secure the assistance of a practical budder and pruner, until the points of which you ask, may be more perfectly understood. There is no mistaking the "valuable" bud. The keeping the tree free from the undesirable shoots which will come out, is by rubbing off with the thumb as they start. Write to A. C. True, Director Experiment Station Department of Agriculture, Washington, D. C., for Bulletin 186, Plant Production by Dick Crosby.

Peach on 'Cot Root.

May I ask: Do nurserymen ever bud peaches on apricot stocks and if not, why? What time is best to bud for dormant buds?—E. E. W.

Peaches have been budded on apricot roots, but the union is not perfect and in later years the orchard may be laid low by heavy wind. Peach, almond or Myrobalan plum roots are usually used. Peach, if the orchard is to be planted in warm loose soil and Myrobalan if in cool, moist, heavy soils.

Time for placing dormant buds is while sap is yet flowing, depending on care of conditions.

Sequel of Distemper.

About two months ago I had two three-year-old mares, which had colts. One colt was four months old and one about two months when they had distemper. Had it very hard. Broke badly and discharged freely from under their jaws. Were about two weeks getting over that. Lost flesh very fast; colts had both bad distemper and ran with mares. Both were on good alfalfa pastures and had good shade and water. None of my other horses got the disease. In about three weeks one of the mares commenced to swell under her front legs, the swelling kept extending back towards her hind legs which also commenced to swell. The swelling was hard, but formed no puss. A gentleman said that we should put in seton or rowel, which we did. They ran a yellowish, oily liquid. In about three days her head commenced to swell as did her

front legs. Her head swelled twice its natural size so she hardly breathe through her mouth. Her eye was swelled closed. She died about a week from the time she commenced to swell. She died two days ago; the other mare commenced to swell the very same way day after yesterday; I am giving her a quart of raw linseed oil; every other gallon of bran mash with about one-half quart of barley with it. She has a good appetite. Her kidneys seem to be all right. Her droppings are a little burnt, but very pronounced. Her coat not dry. Skin somewhat tight.—Yuma.

This is a case of Purpura Hemorrhagica. An eruptive non-contagious fever of the intermittent type usually a sequel of some other disease such as influenza, strangles, distemper, etc.

Treatment: Keep the animal comfortable, give chlorate of potash half ounce dose 3 times a day. If constipated give mashes and a quart of raw linseed oil with one or two drops of turpentine occasionally. If it is bad use carbolic acid in water spray or use sheep dip and water. W. J. Oliver, V. S.

THE IMPLEMENT SITUATION

Dealers in agricultural implements, farm wagons, manure spreaders and other kindred lines will soon begin to inform their customers of an advance in price. In fact, many manufacturers have already made an advance and the consumer may be prepared for it as it is inevitable.

Implement manufacturers have been chased for their work over 100 per cent of iron and steel bars and pipes. The price paid for next year's deliveries is about 10 per cent higher than the contracts that were made a year ago. Pig iron, cold rolled iron, bolts, nuts, washers, screws, in fact, almost every item going into the manufacture of the implements have advanced from 10 to 15 per cent for 1908 deliveries. Lumber, particularly oak and hickory, have advanced steadily in price for the past few years. The average advance for 1908 will not be far from \$100,000 thousand feet. Wagon rims and spokes have advanced for 1908 10 to 20 per cent.

Manufacturers in general feel that they are entitled to better prices. In fact, it is impossible for the manufacturers to continue selling their product at anything like the old prices. Implements have not kept pace with the advance in raw material. High prices of raw material and low prices that implements have sold for have put the manufacturer where he has not enjoyed any of the general prosperity of the year. The raw material man and the consumer have reaped the full benefit.

The farmer has enjoyed the benefit. The figure he has ever secured for his stock in trade. In these times of prosperity when all of the farm products are selling at high prices it is quite necessary that the farmer should have up to date machinery sold at minimum and raise the large crop possible. The farmer who has implemented in the latter part of 1906 and during 1907 at an advance of 10 to 15 per cent may rest assured that the advance is legitimate.

There appears to be no prospects of a slump in the market on raw materials. The situation is rather peculiar along this line. The great protection has made it necessary for the manufacturer to buy his raw material six months to a year in advance, so that he may be sure to have it at the time they are required. Therefore, the manufacturer has been obliged to place his orders for 1908 in advance, and having bought it has been in the matter in position where it looks as if the advance in price must be for at least eighteen months, and when considering everything it is nothing but justice that the farmer should pay the slight advance which is asked to pay as the prices of implements are only slightly above the ones asked when corn was selling at 25 to 30 cents per bushel.

GASOLINE ON THE FARM.

As the farmer figures up at the end of the year he will find that his expenses have been high; that hired man's wages and the day help have taken a large chunk out of his profits, as a writer in The Ranch.

Get a Little.

It behooves the farmer to look around and figure out some way so that his income will be larger and his land kept in a more fertile condition. This means to keep more stock and sell more crops from the farm in the shape of eggs, poultry, pork, nut and beef. It has been demonstrated beyond a doubt that much more good is gotten out of grain by plowing it ground, but heretofore it has been expensive to haul the grain two to six miles, pay a big toll, and waste valuable time. This has kept many farmers from feeding ground feed. The advent of the practical, portable gasoline engine is going to be a big help to the farmer. If he applies the same amount of money that he pays his hired man in one season toward buying a three or four horsepower gasoline engine, buzz saw, grinder, he would find himself in considerably better shape to face the farm labor question and besides save money in the first year over the cost of an outfit that will last him a number of years.

Always Ready.

The engine is always ready. For instance, separate your cream with a separator, and enough gain can be made out of the milk by skimming the way and feeding to the calves and pigs to pay for all the gasoline. Then hitch it to your pump and it pumps enough water to last all day while you are eating your breakfast. Then take your engine to the orchard and saw enough wood in a few hours to last you for a month. Then take your power to the granary, and your feed, cut the fodder, then to the house and churn, and then run the washing machines. Thus it will do the work that he little tanks of now and he will find it an advantage on every turn. There are other uses still unmentioned, such as cleaning seed wheat and unloading. By using a line shaft and a belt drum with a friction clutch, the engine does the work very satisfactorily and the team and man that would otherwise be at work on the farm can be used elsewhere. The engine is controlled by the man on the load.

Original Price Not All.

As to the cost, it is right here where many farmers make their greatest mistake. They buy the cheap engine. Buying an engine is like buying a horse. It makes no differ-

Implements for the Ranch

We can supply everything that is needed in Ranch Implements. If you need a wagon we have the Shuttle—the "king" of all wagons. We also have the Burg, the Harrison and the Winona Wagons—all good.

If you want a Fertilizer Drill, we can supply you with the BUCKEYE, built especially to meet California conditions—and it does it. No better drill is made—we have never seen one as good.

We have the Great Western Endless Apron Manure Spreaders. Every ranch should have one—saves time—saves money—increases crops.

We are the largest implement and vehicle house in Southern California and we maintain our supremacy by square dealing, reasonable prices and absolutely reliable goods.

We want to see you at our store.

Los Angeles, Cal.

once whether you pay \$50 or \$200 for your horse, you generally get value received for your money. And so it is with the engine; if you get a \$90 engine you will get one worth \$90 and no more, while if you pay \$150 for one you will get a machine worth that amount of money. But don't expect the \$90 one to do the work of the \$150 one.

BETTER BE A FARMER.

The farmer boy that leaves his home and goes out in a city to work indefinitely, that he may go to the "Chutes and the vaudeville" sacrifices his life's opportunity for a mess of pottage. There is no advancement for him. He will virtually go backwards, and be exposed to thousands of temptations that the independent agriculturist never knows, says the Colusa Sun. From this country at one time there was a great disposition to go to a city and drive a street car, make a little cash and go sight-seeing. It was soon proven to him that the man who owned his own acre and cultivated it, lived independently, increased his substance and went more sight-seeing once a year than the city fellow, living in the tenement house ever dreamed of. And then he missed being bossed and the following of a leadership to which he must pay a large amount of his salary or wages, or be turned out of his organization "as being a scab or a coward" or some other dirty nickname, and denied the privilege of working where he pleases and for what he pleases, and when he pleases. Some men want to work long hours, some short hours, and some do not want to work at all. So all the time is spent in getting together and talking about it and then getting apart and disorganizing all that small talk. Better stay at home, better be honest and happy than to live in the tricksters' atmosphere. Better be a farmer and win happiness and competency.

ONLY ONE FOR A DOSE

TUTTLE'S ELIXIR.

THE HOME OF "ROYAL DERBY"
Santa Ana, Cal., June 3rd, 1907.
DR. S. A. TUTTLE.

Dear Sir: Having used your Elixir for the past 15 years. I can truly say it will do all you claim for it, it is a sure cure for curbs, splints, sprained tendons, big knees, thrush. I consider it the most valuable remedy ever put on the market and would not be without it, if it cost \$5 per bottle. Family Elixir is as good in the home as Veterinary in the stable.

Yours truly,
H. N. Sylvester.

Household Department

A MIDDLE-AGED LOVE STORY.

With every tick of the clock, my dear,

The days go singing by,
And the skies are blue and our hearts
are true,
And there's love in your laughing
eye.

And never you care if the silver hair
Steals into each golden lock,
For your heart must know you dearer
grow

With every tick of the clock.

With every tick of the clock, my dear,

We drift from the shores of youth,
And we swifter glide on the broader
tide

Of the grander sea of truth.
The flight of time but smooths to
rhyme

Life's every grief and shock,
And we nearer grow in love's glad
glow

With every tick of the clock.

Nixon Waterman.

LOVE—FOR A DAY.

MISS DALLAS, searching for shells, for which the little sandy cove was famous, rounded a corner sharply and came into collision with a man who was apparently engaged in the same search.

It is almost impossible to be dignified when you nearly have knocked a man's cap off his head, and Miss Dallas did the only sensible thing she could do under the circumstances—she laughed.

"I am so sorry," she gasped; "but, you see—"

"We're in the same boat," he said, with a humorous glance. "I assure you it doesn't matter in the least. As a matter of fact, I ought to have looked where I was going."

"So ought I."

"If you are going on," he said, "let me warn you not to go too far past the next point. That is a dangerous cove, and people have been cut off by the tide, which races round that corner, before now."

"I'll be careful," she said; "thank you for warning me."

She bowed, he raised his cap, and after watching her light form disappear round a bend in the rocks he went back to his shell-searching.

He got up presently and looked round the cove. The girl had vanished, and, with a sudden thrill of anxiety for her safety, he saw that the white-crested waves were already dashing their spray to the foot of the point round which she had apparently gone. In ten minutes the place would be deep in foaming water. He set off at a run, shouting as he went, and at last she heard his voice and wheeled around.

"You were mad to go so far!" he gasped. "Do you know we shall only just be able to get round that point? Hurry—run, as you've never run before."

He seized her hand without more ado and they raced back over the golden sand; but on reaching the point they stopped short and looked at each other. A mass of green water was heaving round the rock, too deep to wade through, and growing each moment more turbulent as the great waves, driven before the coming storm, came rolling into the cove.

"It's no go, he said; "we can't do it. The only thing to be done is to find some place beyond high water mark—and wait for the tide to fall or for the passing of a stray boat. If

—there is such a place as a spot above high water mark. I fancy—yes, there's a cave half way along. Do you see the cave? It's fairly high up, and with any luck we shall be safe there, unless—"

He did not finish his sentence, but helped her up the steep, rocky ascent to the cave, which, though small, was fairly dry. He looked with some concern at the signs of the visiting tide, however, in the fresh seaweed and a pool or two in the recesses of the cavern.

And then they began to wait, while outside the waves raced each other up the sandy cove, and every moment the water became more turbulent and deeper against the rocks.

"I—I can't ask you to forgive me for having brought you into this by my folly," said Miss Dallas presently. The man was sitting on a boulder looking anxiously at the rising water on the cove. But he turned and looked at her with a smile, which faded as his eyes met the trouble in hers.

"Then don't try," he said, bluntly; "I'd rather you didn't. If I'd had any sense at all, I'd told you not to venture into the cove, but I didn't realize the tide was running so fast. Are you cold?"

"No * * * Do you think the tide comes as high as this?"

"I'm afraid it does."

"Oh!" The cry was one of pain, rather faint, and, looking at the girl, he saw she had grown rather white. He got up and sat nearer to her, and put his hand on hers.

She told him how she had run down to the west country seaside village just for a week's change and rest, and how fond she was of the tiny place, and as she talked he watched her, noting her lovely eyes, her sweet mouth and the curling hair that grew so prettily round her little head. She was so young, too—too young to die like a rat in a trap. He set his teeth hard at the thought. He wondered suddenly whether she belonged to anyone. * * * He glanced at her slender hands; they were both bare of rings, and instinctively he drew her closer, feeling a shiver run through her as a draught of air was perceptibly colder.

"Are you afraid?" she asked presently, like a child. "Are you sorry about leaving anyone you love—behind?"

"I leave nobody I love," he said a little sadly—"only an uncle. There is no one else. And you?"

"I leave only an aunt," she said; "no one else in particular. I was going to be married, I believe."

Something chilled him—perhaps the wind.

"And you—loved him?" he asked gently.

Miss Dallas actually laughed.

"I hated the idea," she confessed. "I don't think other folk ought to settle those sort of things for one, do you?"

"No," he said fervently with, as it were, a load lifted from his heart. "One should follow one's heart—if it shows one the way."

"It doesn't always."

"Not always—but sometimes it does in a queer sort of fashion. Just when one least expects it. * * * Ah!"

There was ecstasy in his voice, and in the eyes she raised to his in won-

der. Their acquaintance was one of hours only—no more—and yet each other they were all the world. Then a great wave rolled in, swirling about them with a horrible sucking force that nearly drew her from his grasp, and receded with a muffled roar. He set his teeth as he gathered her closer to him; the end was upon them—the end. He prayed it might be short and merciful, and—a sound smote his ears. * * * A splash of oars. With fast beating heart he listened. * * * There it was—nearer. He shouted loudly * * * the cavern gave back a mocking echo. * * * He shouted again, and—a voice answered. The splash of oars came nearer and a boat came into the wide mouth of the cavern. He looked over the girl.

"Dear * * * we are saved!" he cried hoarsely; but she heard him not—a merciful unconsciousness had descended upon her.

* * * * *

Miss Dallas came to, to find herself in a boat supported by her companion's arm; they were swiftly near the shore, and she learned that the coast guard, who had remarked her walking in the sandy cove, and fearing disaster, such as had fallen on others, had come in search of them—just in the nick of time. She began to be taken to the hotel in which she was staying, and there he left her with chivalrous kindness, and promised to come and see her tomorrow. Tomorrow. The word struck a chill to her heart, for had she promised her people before they died that she would, at any rate, favorably consider the offer which James Gaunt was to make to her within the next few months? And her promise to the dead was sacred; if Jim Gaunt chose to ask her to be his wife, she supposed she would say "Yes."

The thought gave her courage the next day when she was told that the gentleman wished to see her. She came into the room where she was standing looking out on the angry sea, for a storm had sprung up in the night, and the bay was a mass of furious breakers; he put his hands on her shoulders. She liked the man—the fullness of his manner and his smile thrilled her. But she steadily put the thought of her promise and Jim Gaunt before her, and wrenched herself free.

"I—I—am not free," she said last, very low, and did not see the tender smile in his eyes, "and—how can you be so cruel! Can't leave me and forget—forget even my name—which you don't know? I forgot that we—we—"

"Were never introduced? Then let us remedy that at once * * * let us talk matters over afterward. I forgot your name when I called to you how you were early this morning. And mine is—Jim Gaunt. Will you send me away now, sweetheart?"

Well, she didn't want to resist any longer, and it was so easy to give way and to let him take her in his arms and whisper all sorts of ridiculous things to her, and as he loved him always—why, that was the easiest thing of all to do—she did it!

—M. A.

A well-to-do farmer, who had sent his son to Denver to begin life as a clerk in one of the big stores, went to the manager asking how the boy was getting along and where he slept at nights. The manager replied: "He sleeps in the store in the daytime, but don't know where he sleeps at night."

RECIPES.

Nut Cake.

cupful of sugar half a cupful of small lump of butter, two one and a half cupfuls of flour, a teaspoonful of soda; dissolve water one teaspoonful of cream. Bake in jelly tins.

Nut Cream.

a cupful of sugar, quarter of a of flour, one egg. Mix to and turn into half a pint of previously heated in a double add two large spoonfuls of out and stir until thick. Make for the top and sprinkle with freshly grated cocoanut.

Cake.

make coffee fruit cake, beat pound of butter to a cream; ne cupful of brown sugar. Dis- a teaspoonful of baking powder o tablespoonfuls of water; add half a pint of New Orleans mo- add this to butter and sugar; teaspoonful of allspice, one egg beaten, a tablespoonful of cinna- and one grated nutmeg. Mix a of a pound of shredded citron, pounds of seedless raisins and quarters of a pound of cleaned ants. Measure three cupfuls of flour; take sufficient from it to the fruit thoroughly. Add half of warm, strong coffee to the mixture; then add to the flour; until smooth; add the fruit, pour well greased cake pans and bake in a moderate oven.

Straws.

and cut into strips one-eight inch in depth and width. Have a bowlful of cold salted water, which has been added the juice of all lemon. Put the strips in this and leave for fifteen minutes cool place. Dry thoroughly and boiling fat. Send to the table dish.

to and Cheese Salad.

a slice of tomato on a leaf of and cover exactly with a very round of American cheese; with mayonnaise, add another of tomato and put a spoonful of naise on top.

Frappe.

is quickly made. Dissolve a of maple sugar in a quart of water and strain. Put in the can and when cold turn the until it becomes stiff; add one- cup of any liqueur and turn after removing dasher whip perforated spoon until smooth, set aside for an hour. This rapidly so should be used as as ripe.

Custard Pie.

following sent from a sub- r, a warm friend of the Cultiva- ks good: a medium-sized peaches that are red around the seed and halve then line a good-sized pie-tin a good bottom crust, do not roll in, rub flour over it and lay in peaches with red side up, one layer, over the crust, close to- r, then, beat one egg to a froth, pinch of salt, one pint of sweet one tablespoon flour stirred h in the milk, three tablespoons pour over the peaches and bake oven. AUNT LIZZIE.

HOMELY HINTS.

en laying matting, place several cesses of newspaper under it, catch the dust which sieves gh. After a thorough sweep- , refresh matting by going over it a cloth dampened with ammonia t.

You ought to clean all the drain pipes connected with the house at least once a week, by flushing them with hot sal soda water, or lye solu- tion.

Never attempt to wash windows when the sun is shining on them.

Fruit and ink stains, as well as mildew spots can be removed from white goods by soaking them in sour milk. Silver can be cleansed in the same way.

People drink too little water. Suf- ficient should be taken each day to so flush the system as to carry off waste and poisonous matter from the blood.

The flat, insipid taste of hot water which is so objectionable to many persons, can be removed by aerating it. Pour it from one cup to another.

Water bottles and flower vases that have become stained from use are easily cleaned by the use of potato parings with water enough to cover the stains. Leave in over night. A cleaning pad may be made by cutting a groove around a long stick near one end and tying a bit of cloth securely to it. The cloth should be doubled up so that it makes a round, ball-like covering for the end. With this, ugly stains may be reached that would otherwise be inaccessible.

TRAGIC TEASING.

A young woman drowned herself near Wilmington, Del., the other day because she could not endure the playful taunts of her associates about a trivial personal matter. She had begged them to stop, but they per- sisted. She then threatened to end her life if the persecution continued, and still they teased her. Then she carried her threat into execution, and now the young people who engaged in their pastime of annoyance are over- whelmed with regret.

This tragedy carries an impressive lesson, applicable to great numbers of people who do not realize the sensi- tiveness of others. Of all subtle cru- elties none is more abominating than the persistent reference to a subject that is painful to another. Yet this form of torment is indulged in con- stantly. Parents tease their children about things that may seem trifling to them, but are serious and impor- tant to the little folks. They cause great suffering of mind by thus in- cessantly "poking fun" at the young- sters whom they are supposed to cherish and guard from pain. The ex- pression is often heard: "Oh, it is good for her. She is too sensitive. She will have to get used to being criticised and teased while she is young." Yet this very treatment is calculated to render the child more keenly susceptible to mental torture than before. It may not be doubted that many a child's nature is warped by injudicious jocularly on the part of its elders.—Washington Star.

PLEASED.

Keep track of the little figures after your name on wrapper or on cover. On it you have a weekly statement of the condition of your subscription payments. If it says 1-08 it means that you are paid to Jan. 1 next. It affords satisfaction to know the con- dition and aids in preventing mis- takes. A Berkeley subscriber keeps tab on the little figures and writes as follows:

"Enclosed find \$1.00 for subscrip- tion to the Cultivator for July, 1907 to July 1908. On the wrapper you have it '7-07' please change to '7-08' Am well pleased with the paper." WINFIELD S. RUNDE, Berkeley.

HONEY.

I HAVE 1200 POUNDS OF HONEY FIT for feeding bees, dark amber, which I will dispose of very cheaply. DAVID BERTSCH, Hermosa Beach, Cal.

GRASS A SOIL BUILDER.

Grass is a soil protector, a soil renewer and a soil builder. Covering the land with grass is nature's way of restoring to old, worn out soils the fertility and good tilth characteristic of virgin soil. The true grasses do not add nitrogen to the soil, as do clover and alfalfa, yet they are in a sense nitrogen gatherers in that nitrogen of the soil is collected and stored up in the roots of the grass in the form of humus. Thus grasses prevent the waste of nitrogen and other plant food elements and serve to protect the soil and to maintain its fertility. By extensive and deep penetrating root systems many grasses also tend to break up and deepen the soil, gathering and storing plant food in their roots, and thus actually increasing the available plant food of the soil.

The Produce Markets

Los Angeles

Markets

LOS ANGELES, Sept. 4, 1907.

Butter.

"The butter trust has advanced another 2 1/2 cents," is the claim on the market. Whether its trust or not the price is up one more notch since last issue. This is claimed more in the interest of holders of Eastern, of which there is a large supply stock in storage.

Kaffir Corn... 1.65

Farm-made manures are the most valuable in improving the physical condition of the soil. Commercial fertilizers are apt to make soil heavy, while the barn-yard article lightens up the soil and sets other factors to work.

Don't be afraid if the sorghum makes a slow growth at first. It grows very slowly for the first month, and for this reason the seed bed should be as free of weeds as possible, before the sorghum seed is put into the ground.

Hay.

The weekly trade circular of Scott & Magner, descriptive of the hay market, is as follows:

Arrivals of hay for the past six days have been 5600 tons, which is just about the average of what has been arriving for two weeks previous. The railroad situation is most unfortunate. Hehe we are at the first of September with an immense quantity of hay at various railroad points where there is no storage, and the railroad unable to furnish cars to transport this hay to market. It looks certain that much hay will be caught by the first rains and badly damaged. Every effort is being made to press the railroad company to furnish cars all over the system, where hay is awaiting shipment. The records show comparatively light arrivals here in San Francisco over the southern Pacific and Santa Fé roads. It does not look as though we could expect anything better in service from the railroads, than we have had of late. This transportation condition is the key to the present situation.

Demand for hay during the month of August has been comparatively less than it has been for several years. Last year at this time there were not any teams enough to handle the business. At this time there are many teams idle, showing that the consumption here has decreased considerably.

The market on choice hay, of which there has been comparatively little coming in, has remained firm, but the medium classes of hay are drooping, and in many instances are being sold at lesser figures than during last week. Poor quality of hay is in very light demand, as the trade generally requires the better qualities.

The market on alfalfa hay is practically unchanged. Arrivals have been moderate and the demand rather light.

There is little more straw arriving than heretofore. The demand is light, though the market remains steady.

Alfalfa local	11.00@13.00
Alfalfa oat	15.00@16.00
Wild oat	10.00@13.50
Wheat No. 1 new	19.00@20.00

Grain.

Regarding the grain situation the Chronicle says:

As far as stability of prices is concerned the local grain market is in excellent condition. The choice grades are very firmly sustained and holders are not offering very freely, owing to belief that still better figures may be obtained a little later in the season. The volume of transactions continues rather small and as has been the case for several weeks the demand is largely confined to medium-class stock. The local speculative situation is dull and devoid of interest.

Citrus Market

LOS ANGELES, Sept. 3, 1907.—The supply of oranges is becoming reduced, but that but little interest remains as citrus markets. Probably but little over 150 cars now remain in the state and these are being rapidly forwarded. The best of prices prevail. Lemon shipments are very light at the quality is good and good returns are made the growers.

Citrus Shipments.

Shipments of citrus fruits for season 1907 cars of which 3223 were lemons. Same date last year 25,275 of which 51 were lemons.

NEW YORK, Sept. 3.—The market is slightly higher on extra fancy stock and steady on other grades. Weather hot and muggy. Seven carloads sold.

FERTILIZER FOR WHEAT.

In some parts of the East farmers giving up wheat growing. Many of them think it useless to try and compete with the newer and richer soils of the West. Many argue that wheat growing is profitable only on new and rich soil. Mr. C. R. McKensie, of Westfield, New Brunswick, undertook to see if by the use of chemical fertilizers on poor soil he could not compete with Western grain fields.

He selected a piece of dark loam, slightly gravelly soil which had had no fertilizer for ten years. It had been in grass, and farmers can readily understand its poor condition for grain. In order to test the soil, Mr. McKenzie used nothing on one part of the field. On another part he used Thomas Phosphate to supply phosphoric acid and nitrate of soda to supply nitrogen. On another part he used the phosphate and the nitrate and in addition, muriate of potash. The object of this was to see which element was the key to a wheat crop on that soil.

The natural soil gave only 10 bushels. The phosphate and the nitrate brought the yield to 25 bushels, but when the potash was added there was an increased yield of 16 bushels per acre. It is evident that this increase was directly due to the potash, and when we compare the cost of the potash with the price received for 16 bushels of wheat we see that few other farm investments could have paid so well. Consider the price of wheat and straw on an Eastern farm and it is plain that no Western wheat field can compare acre for acre with such a yield as 40 bushels. The main reason why some Eastern farmers say that wheat will not pay is because they use the wrong kind of fertilizer. They use a smell of nitrogen, a peck of phosphoric acid and a pinch of potash. No wonder their yield is poor. Mr. McKenzie's experiment shows why. The wheat crop demands potash. If the soil will not supply it the fertilizers must do so.

A fly buzzes its wings at the rate of 352 times a second.

See us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

CONGO

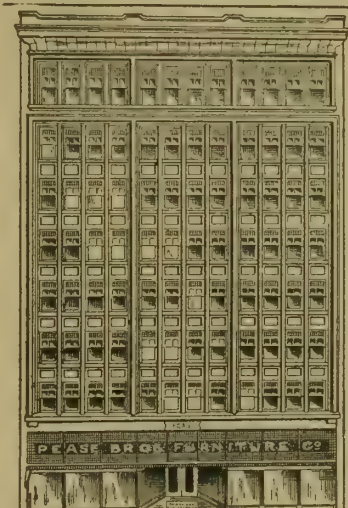

THE NEVER-LEAK ROOFING

Congo can't leak, or rust, or rot, or melt in the sun, or freeze in the cold, or dry up, or get brittle, or crack, or rip off in a wind.

Congo can fit snugly on a roof, keep out the rain, the snow, the damp and the cold for many years, with a minimum of care and attention.

Its strongest point is its durability. Send for a free sample.

Business Notes

THE SEPARATOR NEWS

for Autumn, will be ready for distribution September 15th.

About farm separating, and especially about the Tubular separator; illustrated in colors; offers catalogues, "Business Dairying," matchholders, mirrors pictures.

The News also tells about the piano competition open to buyers of Tubulars during 1907.

The Separator News is free to those asking for it. Three illuminated post cards, will be sent to those who send the names of two other persons, interested in dairying, who do not own Tubular separators.

The Sharples Separator Company, West Chester, Pa.

LAST A LONG TIME.

One of the old-time houses of San Francisco which manufactured tanks for many years, is that of Mr. Geo. Windeler of 144-154 Berry St.

Mr. Windeler says that he believes in the motto that "Tanks that are well made will last a long time." If they last a long time, long time friends are made, and the business grows because of this.

Water tanks and wine tanks are both made and all from carefully selected stock. Cultivator readers who may be interested should write this house and get prices.

It may save money.

ABOUT FIXING THE ROOFS.

You will find in the advertising pages of this issue an announcement of a new free book about fixing up the old roofs.

You can have one of these books by writing to The Anderson Manufacturing Co., of Elyria, Ohio, and mentioning the Cultivator.

It is full of good, sensible suggestions for saving money on roofing. Write for it. It's worth while.

AT THE STATE FAIR.

Many in this State who have never seen a foot-power milking machine can do so by attending the State Fair at Sacramento next week.

The A. F. Steiner Co., of Berkeley, will have a machine in actual operation daily with demonstrators to explain its care and working.

Even the Japs are forming a union and are to have control of the Lodi labor situation. One of the steps already taken is to advance wages from \$1.75 to \$2.50. Growers are compelled to pay the price or allow their fruit to rot on the vine.

California tax payers are regaled with the fact that their money can be paid out in the interest of the State Fair at Sacramento, along certain lines, only upon consent of Labor Unions.

Warehouses at Stockton are rapidly filling with wheat and barley from the upper San Joaquin country. It is the heaviest for this time of the year for many a season.

A Life Income from Land Investment

7 per cent. guaranteed, payable semi-annually. No risks. Sugar plantations pay 33 1-3 and more when in full cultivation. One planting good for dozen years.

We own 9489 acres of richest land in State of Vera Cruz, Mexico, near Tampico. Sell you one to a hundred acres and contract to cultivate for fifty years and pay you the profit.

Best Crop Profit in the World

No other crop in the world as rich or as certain. Our plan is simple and safe. Your money does the work for you.

We Do All the Work—You Stay at Home and Enjoy the Profit

It will pay you to know more of our sugar plantation profit-sharing plan. George Gould, speaking of this section, says: "The great Southwest will surprise the world in the next ten years with its development." Let us tell you more.

Welcome to Irrigation Congress

Scene on the Sacramento River in Colusa County

Ye are welcome, Irrigationists, to California's clime!
You have rivered on in triumph since the old Egyptian
time;

You have fertilized the valleys of the Ganges and the Nile,
And Romantic days in Britain were embrightened by your
smile.

The Colorado desert you have made a garden home
For thousands of our people, and for thousands yet to come,
And Sacramento's river, while cascading to the sea,
Will lend its waters to the soil for grain, and vine and tree.

All round about Los Angeles, the southern country o'er,
To orange, walnut, lemon grove, you give the open door;
And through expansive Stanislaus, on every hand behold
The wealth that Irrigation brings—its blessings manifold.

When Ceres holds high festival throughout the San Joaquin,
And children on their May Day crown the fairest daughter
queen,

Our happy country people, mid fields of golden sheaves,
Pay grateful tribute to you beneath the oaken leaves.

See yonder grand procession, marching on through Fresno's
vines!

They gather muscat, emperor, and grapes for finest wines;
Three hundred thousand acres now are passing in review,
And this—the vineyard of the gods—was given us by you.

Ring out the bells of welcome, then, for Irrigation's host!
They come to us with tidings glad—they make the joyful
boast;

"That California's arid land, from sea to mountain height,
Shall be the homes of plenty—the Harvest Moon's delight."

Ye are welcome—yea, thrice welcome! In Memory's Hall of
Fame

You have builded lasting monuments in Irrigation's name;
Not painted masterpieces of achievements in veneer,
But you have made the harvest home a harvest all the year.

—J. J. Galvin

Coulson's Improved Mash Egg Food

**Takes
Less
Feed

Makes
More
Eggs**

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

The National Irrigation Congress

The Greatest Meeting Ever Held by This Representative Body
of Americans Working for the Advancement of Arid America

WHILE it cannot be said that the Irrigation Congress, held in Sacramento last week, was entirely harmonious, it is true that in main the right spirit predominated and taken that cannot help but result in great to the irrigation and forestry interests of State in particular, and of the nation in general.

It was a fairly representative body and dominated by some of the brightest minds in the country. That the "kicker's brigade" put in evidence is not at all strange for, with question, there are men who have grievances they wish to air at these gatherings. There are also unscrupulous men who use every occasion to work out their own selfish aims, possibly to set up the cry of "stop, thief" in order to throw discredit on a good movement and attract attention from their own real motive. But if all there were many great addresses made, generally in favor of complete support of policies of President Roosevelt in the matter of reclamation of arid America. In fact, one of the notable incidents of the convention was the reading of President Roosevelt's message to the congress which was as follows:

The officers and members of the National Irrigation Congress, Sacramento, California.

Men:
Send you hearty greetings, and my earnest wishes for the fullest success of your convention. I congratulate you on the progress of the movement you represent. There is no movement more emphatically for the benefit of the small farmer and the small ranchman. There is no other way to assist the actual settler and the farmer who owns and tills his own land so successfully as through this movement of yours for the wise use and preservation of the waters of the forests. The reclamation service and the irrigation service are directly adapted to help the farmer make and maintain a prosperous home, and they are doing it. These services were recently inspected on the ground by the Secretary of the Interior and the Secretary of Agriculture, who have them in charge, and I congratulate you on the high standards of integrity and efficiency which you have attained.

It is a matter of sincere satisfaction to learn that you will not confine yourselves to questions of irrigation and forestry, nor even to the conservation and conservation of streams, vastly important as these are to every citizen of the United States. I am glad to know that you will pay attention to that problem of which forestry, irrigation and water conservation form but part, the fundamental problem of the conservation of all natural resources. The work of the movement along the line of this greater problem cannot be made effective without the approval and support of the whole body of citizens. Educating, guiding and crystallizing public opinion in this direction, by bringing the needs of the people clearly and forcibly to the knowledge of their representatives, you are rendering a service of the first importance to the nation as a whole.

THEODORE ROOSEVELT.

The welcome to the delegates to the State of California, Governor Gillett extended a most cordial welcome and the offer of the greatest of God's footstool. Among other things, he said:

The delegates loved the sunshine, the flowery mountains, the fruits, all God's gifts, he gave it to them freely—for a few days. They wanted them to remember that it was for a few days only, during the session of the congress. He put the State of California in their hands for the session and would expect it returned at the end of it, with the forests conserved, the great navigation schemes carried out perfected. He did not want them to go

away, but if they had to, he hoped to see them come back later and the State would give them citizenship, and they were welcome to that, too. He extended to them a hearty welcome—a California welcome—the heartfelt welcome of the people of this glorious State, and hoped their session would be both pleasant and profitable to them.

Vice-president Fairbanks made a strong address which compelled the delegates to say that he was not so cold after all. Regarding the work of the government along reclamation lines, and the benefits to the arid west and the nation as a whole, he said:

The suggestion that the government should

unproductive land has become the most fertile. From the worst it takes rank as the best. It is hard to find anywhere more apparently unproductive land than that which is occupied by sagebrush and no more bountiful harvests are gathered than those which this same forbidding land produces when touched by the vitalizing influence of irrigation. There are promising fields today where there was no sign of habitation before we entered upon the present reclamation policy, and what is being done is but prophetic of what we shall accomplish if we faithfully adhere to the policy upon which we have entered and carry it out to the limits of its possibilities.

The storm center of the meeting was the resolu-

An Irrigation Canal in Colusa County, California

Scene Near Princeton

participate in the work of irrigation awakened some opposition among those who had given little thought to it and who failed to realize its tremendous possibilities. I look upon no incident of my public service with more satisfaction than the support which I give to the reclamation act upon the statute books. The measure now speaks for itself. Its critics have become its supporters, and the marvel of it all is that its virtues were not earlier foreseen and such a measure sooner enacted. The work of development under it may sometimes seem to be slow. The results, however, are sure. Those who are familiar with what has been done by the government will agree that much progress has been made and that the faithful execution of the law will result in bringing under a high state of cultivation many millions of acres of land which are now unproductive.

The effect of irrigation in this western country can be appreciated only by those who are familiar with it from personal observation. The change made in the conversion of an arid waste into fruitful fields seems almost incredible. There is no more radical transformation to be found anywhere than in the parched valleys and plains which have been irrigated and which prior thereto produced nothing but sagebrush. The most

lution committee. One of the warmest discussions being on a topic not closely allied to irrigation, or at least not to the supposed aims of an irrigation congress, but at the same time very near to the heart of every deciduous fruit grower of California. This was a resolution offered by A. R. Briggs calling for an expression of the congress that the Department of Agriculture's ruling in regard to the sulphuring of dried fruits should be modified and rendered less unjust to the producers. This resolution was laid on the table in committee as was another resolution referring to the manner in which Los Angeles had obtained permission to use the water from Owens river.

Dr. Pardee told of how he and President Roosevelt were once riding through a smoke-clouded forest. The hot smoke choked them and they were scarcely able to speak.

"Governor Pardee," inquired the President, "what causes this smoke?"

"The lumbermen are burning brush," was the reply.

"Damn the lumbermen!" exploded the President.

"And I being a devout Governor," said Dr. Pardee, "uttered 'Amen.'"

Dr. Pardee then went on to say that the President remarked that he did not damn the good lumbermen, only the bad, and to this he then Governor uttered another fervent "Amen."

Sacramento did herself proud and entertained royally, closing the great Congress with a spectacular display worthy the great subject.

Deciduous Fruit Culture

UNFERMENTED GRAPE JUICE.

UNFERMENTED grape juice is a refreshing and nutritious beverage that may be had by all farmers who have a few grape vines. There are several large grape juice factories in California, in which much special machinery is used for the purpose, but for the farmer who wishes to put up a few gallons, this is not necessary. By following a few simple principles the work can be satisfactorily done.

Extracting the Juice.

Grapes that are fully, but not over-ripe, are selected, thoroughly washed in clean water after removing any parts of bunches that may be decayed. If an ordinary fruit press is at hand, the grapes may be ground and pressed through that. Not having this, place the grapes in an open vessel and crush with a potato masher. It is better when making a small amount of juice to pick the grapes from the stems. After the grapes have been well crushed, put them in a cotton bag of rather loose web and extract the juice by twisting. If the weather is cool, it may be hung up and allowed to drain over night. A colander may be used by placing a plate on top of the bag and a heavy weight left on over night. Place the colander in an earthen dish.

Filling and Sterilizing.

Fill quart fruit jars, if nothing in glass jars is at hand, to within an inch of the top; place in a wash boiler with a wooden rack in the bottom so as to keep the jars off of the metal bottom, fill with warm water to within an inch of the tops of the jars and heat till the temperature is 185 degrees Fahr. Have the metal tops of the jars in a pan of boiling water ready to put on the jars. Place over the tops of the jars circular pieces of filter paper which can be bought at any drug store, and screw the tops down over them. Two papers on each jar should be used. Set the jars away in a cool place for a couple of weeks when the sediment will have collected in the bottom.

Clarifying.

If it is desirable to bottle instead of putting the juice in jars, fill the bottles within an inch of the point below where lower end of the cork will be when inserted. Place the jars in the wash boiler as indicated above. Be sure to have the wooden bottom in the boiler. Heat the water to 180 degrees and allow it to stay at that temperature for twenty minutes. Have new corks handy in a hot paraffine bath, take them out with a pair of tweezers and place them in the mouth of the bottles before taking them out of the water. The bottles must be removed from the hot water immediately after inserting the corks or they will be forced out by the generation of the steam. The corks should be forced into the bottles at once and resealed with a light painting of hot paraffine. This will so completely seal the contents of the bottle that there will be no possible chance for it to become inoculated with the elements of fermentation.

Should fermentation take place later on, it will have come from bacteria already within the juice or bottle.

Where the grape juice is for home use entirely and the presence of sediment is not objectionable, the second heating is not necessary, though it is

much safer. The fungus spores that are in the liquid may not all be killed at the first heating and the second time they may be in a more susceptible condition when the heat will exterminate the last of them. When a clear juice is desired, it is necessary to heat twice. After heating the first time and allowing it to settle as described above, drain off the liquid and be sure not to allow it to get as hot as at the first heating or another lot of sediment will be desposited.

To Give Color.

Zinfandel makes one of the best unfermented grape juices. Some of the sweeter kinds are sometimes used but they soon cloy while the more acid sorts do not. Most black and red grapes have a clear juice. If it is desired to have a colored juice a few skins of a black variety heated to nearly boiling will give a red juice that will give good color. There are several varieties of grapes that have red juice. Alicante Bouschet is, perhaps, the best. Manufacturers of unfermented grape juice pay an extra price for these grapes for coloring purposes.

FRESNO GRAPE OUTLOOK.

Regarding the raisin season which is now well on, the Fresno Republican says:

"Picking of Muscat grapes for table use has been in progress now for a week, and the picking of raisins will commence within the last few days of this month, or possibly sooner in some sections. The crop is better than it has been in the last two years, but not so large as was expected a few months ago.

"Vineyardists say that the crop is in good condition, and has not been hurt by the unusually cool weather this summer. The grapes now being picked for table are very sweet, and do not seem to lack sugar. From present indications, the grapes should have a good proportion of sugar when ripe and ready for the drying. Muscats are a good crop, better than the black grapes in most localities.

"The consensus of opinion among the leading packers of this section places the maximum size of the crop at not more than 60,000 tons, despite higher estimates which have been made at times. Last year's crop was about 50,000 tons. The growers also agree that the talk of a 'phenomenal' crop is without foundation, beyond the fact that this year will have slightly more than the average, and will even be exceptional in some localities. Enough grapes to lower prices made, however, do not seem to be in sight.

"The black grapes are a shorter crop than the Muscats and Malagas, and will not all go to the wineries, even then. Many of the vineyardists say they will dry and convert into raisins as many varieties as can be handled in this way. Although the finished product in no case is as valuable as the Muscat raisin, still even as the under prices, more can be realized from them as raisins than as winery material. Besides the Muscats, raisins will be made extensively this year from seedless, Malaga and some varieties of black grapes, unless the wineries come through with a higher price.

"As to comparisons between this and last year's crop of the wine grapes one winery man said he could determine better when he had his stuff in the winery, but did not believe he had as much during the former season. His vineyard is a representative one.

"It is still a little early for specula-

tion as to the exact tonnage of the Muscat crop this season. A large amount of conjecture is naturally involved in the predictions made. Judging from present indications, the year is to be a remarkably good one for the grower, however.

"Practically all of the seedless table grapes have been shipped from the vineyards and the Malaga season is at its height. By the time the Malagas have played out the Muscats will be at their best."

A RAISIN FESTIVAL.

Regarding the "Raisin Festival," and its mission, in Fresno this week the Republican says:

"The entertainment of an exceptionally important set of visitors will be the purpose and the inspiration of the raisin festival this year, and its character will be determined by that end. But it is worth while to make this the beginning of an annual vintage festival, developed in our own way, for our own purposes, which may become a permanent custom. The genial vintage festivals of the old world are probably beyond our reach. They are the traditional outcome of the pleasure-seeking instincts of a people who have lived for centuries in the same place. Ours must be more less artificially organized on business principles. There the actual working grape gatherers, men, women and children, are the center of the revels. Here, the gatherers are mostly Japanese, Chinamen, Indians or imported whites, of whom we have a hideous tradition that the only amusement we need to provide for them is the tenderloin. A European vintage festival is a thing to be dreamed about, but we cannot do it. We can, though, do something less poetic but more practical, which will be worth while. In trying our hand this year, we may learn some lessons for the permanent future."

WHAT'S IN AN APPLE?

The average per centage of juice extracted from apples during the process of cider making is much less than is usually supposed. A little over 50 per cent is about the average. The average water content of apples is about 80 to 85 per cent and the dry matter 14 to 20 per cent. An 80-ton hydraulic press at the Virginia Experiment Station only succeeded in extracting 74 per cent of the total weight of the fruit which was the juiciest to be had. A large per centage of the juice contains solids held in solution. 70 per cent extracted is a high average for the best presses.

Summer varieties contain less juice than late varieties and all varieties vary according to the stage of ripeness. Some varieties are naturally low in juices and crab apples run the highest. Commercial presses, according to the Virginia Bulletin, extract a little over 53 per cent of the fruit.

The loss of sugar in the pomace is great, being as high as 65 per cent and in no case less than 30 per cent. The average for summer varieties is about 45.5 per cent; autumn varieties, 44 per cent; winter varieties, 40.7 per cent and crabs, 38.3 per cent.

By adding some water to the pomace, a good quality of vinegar ought to be secured.

An acre of peach trees will in ten years use 490 pounds of nitrogen, 125 pounds potash, 300 pounds phosphoric acid and 370 pounds lime. This calls for good culture and fertilizing.

A private letter to a Rivera walnut grower, says that the French crop of walnuts will be very light this year.

General Agriculture

CEMENT ON THE FARM.

WITH the wonderful development of the Portland cement industry during the past fifteen years, comes the most ideal building material ever produced. This is the beginning of the "Cement Age."

The price of lumber is advancing to almost prohibitive figures; it is, therefore, natural that a substitute material with the advantages of moderate cost, durability and beauty should be developed and looked upon with favor.

Today cement can be successfully used on the farm in the place of wood in the construction of floors, troughs, gutters, tanks, ditches, dams, walks, posts building blocks, etc.

Prof. H. M. Bainer, of the chair of farm mechanics, at the Colorado Agricultural College, makes the following valuable suggestions:

Cement.

Use nothing but the best cement that can be obtained. It should be in a fine, powdery condition and contain no lumps. Cement should be stored in a dry place, as dampness is an element of great danger.

Sand.

The sand used should be clean, sharp and not too fine. It should be free from loam or clay, as these will tend to destroy the adhesive quality and to retard the setting of the cement. Clay mixed with the sand may be removed by washing.

By sharp sand we mean that the edges of the grains must be sharp and not round or worn off, as will often be the case with sand found in the bed of a stream. Coarse sand is better than fine sand. Fine sand, even if clean, makes a poorer mortar or concrete and requires more cement to thoroughly coat the grains. A large proportion of the grains should measure from 1-32 to 1-16 of an inch in diameter. Some fine sand is necessary to help fill the spaces between the larger grains, thus saving cement.

Water.

The water used should be clean and free from acids or alkalis. For making the best concrete, add just enough water so that when all the cement is in the form and is well tamped, moisture will show on the surface. The tamping is a very important operation and the quality of the work is dependent upon how well this is done. Unless this is thoroughly accomplished the concrete is likely to be honeycombed and imperfect, especially near the forms.

Proportions.

For ordinary farm construction, as the making of floors, walls, walks, gutters, etc., the following proportion is to be recommended: one part cement, two and one-half parts clean, loose sand and five parts of loose gravel or broken stone. For floors this should be tamped into a depth of from five to eight inches. This should be finished with a surface coat one to one and one-half inches in thickness, composed of one part cement and one and one-half to two parts of clean, coarse sand, mixed. Nearly all constructions which come in contact with water should be covered with a mortar at least as rich as the proportion last named. For engine foundation, one part cement, two parts sand and four parts broken stone is best.

In estimating the amount of material necessary for a certain construction, do not make the mistake of

thinking that a mixture of one barrel of cement, two and one-half barrels of loose sand and five barrels of gravel or broken stone will make eight and one-half barrels of concrete. The sand will fill the voids between the gravel or broken stone and the cement fills the voids between the grains of sand. The total amount of concrete will be but slightly more than the amount of gravel or broken stone used.

To make one cubic yard of concrete of the following proportions—one part cement, two and one-half parts sand and five parts gravel—requires about one and one-fourth of barrels of cement (five sacks,) three and one-fourth of sand and six and one-half barrels of gravel.

Mixing.

Be very careful in measuring the

proportions. Mix the concrete as near the place it is to be used as possible. Use as soon as mixed. Do not mix too much at once.

Measure the sand first and spread it in an even layer in a mixing box, place the cement on top and turn it with a shovel at least three times. Then add the broken stone or gravel which has previously been wet, and turn the whole at least three times. Begin to add the water on the second turning, not too much at once. A sprinkling pot is better than a hose for adding the water, as it does not wash away the cement.

An objection is sometimes raised that concrete floors become slippery when wet. This fault is largely due to the fact that the finishing surface was completed with a steel smoothing trowel instead of a wood trowel, or smoothing board, which would have left the surface rough. This fault is also overcome in a great measure by dividing the wearing sur-

face into small squares about four inches on each side by means of triangular grooves three-eighths of an inch in depth. This not only makes a neat appearance, but furnishes a good foot hold for stock.—H. M. BAINER.

RECOMMENDS THE CULTIVATOR.

A good example is set by a San Bernardino subscriber in speaking a good word for a good paper. That is, in speaking to his neighbors about it. If the paper is good it gives justice to both the paper and to the neighbor to do this. When remitting the subscriber said:

"As for the Cultivator it is certainly a fine paper, most helpful and instructive. We do not find any paper of the kind equal to it. We have recommended it to numbers of people. We can never speak too highly of it. It is certainly worth more than the price charged.—WILLIAM ROBISON, San Bernardino, Cal.

Don't Spoil Good Barns With Poor Roofs

Give them roofs that will endure to the very last—that will always be water-proof, wind-tight and fire-resistant—that will keep their contents dry as tinder.

REX ROOFING

FLINTKOTE

is made of long-fibre wool felt. It contains no burlap, no paper, no wood-pulp, no tar—nothing to weaken it and allow it to sag or stretch on the roof. This fibre is thoroughly saturated with water-proof materials. It does not warp or blister in the sun, or crack or break in the coldest weather. You can set a live coal on it without its catching fire. It will not stick to the roof-boards. It will make a building warmer in winter and cooler in summer. It leaves rain-water free of taste.

Rex Flintkote makes roofing an easy, fast, satisfactory job. Your farmhands can lay it. Everything needed, but the hammer, is in the roll. It costs less, in the long run, than any other.

Every roll has our trade-mark, "Look for the Boy." Don't take anything else. If your dealer hasn't got it, let us know.

SEND TO US FOR FREE SAMPLES

that you can examine and test, and prove our claims. They will convince you that Rex Flintkote Roofing is the roofing you have been looking for. A booklet on roofing comes with the samples. Send for these right away and get on the right side of the roofing question.

Because You Need The Money

It's your business and if you don't
attend to it, who will? You cannot
afford to keep cows for fun. That isn't
business, and, furthermore, it isn't
necessary. There is money in cow
keeping if you go at it right, and be-
sides there is more fun in going at it
right than there is in staying wrong.

You need a Tubular Cream Sepa-
rator because it will make money for
you; because it saves labor; because
it saves time; because it means all the
difference between cow profits and
cow losses.

Look into this matter; see what a
Tubular will do for you and buy one
because you need it.

SWINE.

THE present price of pork is high enough to induce the farmer to turn his attention to the care of swine. The pigs that have been crowded into the background, out of the sight on the ranches, now wears a golden ring in his snout. If we drop to the material plane in life with Butler we may ask about pigs:

"For what is worth in anything
But so much money as 'twill bring."

There is money, plenty of it, in pigs at present. Now let us see if we cannot talk about it intelligently enough to help some of it come to the farmers.

At Home.

The six sows on the ranch produced, in April last, fifty-one pigs, none died, all are thrifty and growing finely. Now how is this success brought about? By keeping them healthy and feeding enough, but not overfeeding, plenty of fresh water and careful oversight. Pig cholera and like diseases are guarded against by careful quarantining for three weeks any new animals introduced into the herd.

The Sow.

The ordinary farmer has sows enough of home breeding to start a large band. Now, as a start toward profitable breeding, every sow should have a metal tag put into her ear with a number on it. We use the Dana tags and find them reasonably satisfactory. After using other stock markers we come back to the Dana as having the least faults, for all of them are often torn from the ear by the barbs on the wire fences. Keep a book record of the sows and if a sow does not produce and raise a good sized litter of pigs, turn her off into the fattening pen.

The Pigs.

Watch the pigs and select the sows for the next generation from the ones that mature early. The pigs should not be two years in maturing into hogs. It will cost too much to keep them during the last few months. The local market here is for fat pigs weighing a hundred or hundred and fifty pounds rather than the heavy lard pigs. There are usually enough sows and stags coming to furnish lard for local demands, while the compounds from the meat packers in the Middle West furnish the hotel trade.

Type of Sow.

The sow should have great depth, very large around the stomach and chest, while a long body is often insisted on as necessary. I have often found that the most prolific individual sows were not the longest ones. That many successful mothers belong to the middle-size bodies types of sows. The longest-bodied ones are usually selected in buying sows, but I think it is wiser not to select those that are too long or they may be weak in the back, rather a good proportioned animal. Balance being better than excess in any particular.

Theory—Practice.

While scientists dispute the fact that certain qualities are transmitted by each parent rather than that the offspring is a mixture of all the qualities, the farmer has an idea that is grounded into him by years of obser-

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

vation that the boar transmits the extremities as the legs, the bone, the general style to his offspring. The placing of the fat in streaking the lean with fat, the shape of the hams and the thickness of the bacon are all from the boar. While the sow gives size and vigor to the heart, lungs and strength of constitution to the offspring.

The Boar.

The boar should show the general characteristics of the sow, but his neck is thinner, forehead broader and throat and face freer from excessive, fatty tissue. The back should be wide and level and well sprung as the ribs of a hackney cab. The body should be deep. In swine there is not the marked difference in style between the sexes as there is in the horse. It is, therefore, easier for a novice to raise good pigs, for he can readily see the points in a boar, as they are unobscured by the adornments that nature adds to the male to increase his attractiveness.

Fancy Stock.

How often an inferior horse is used by farmers as a sire because of the beauty of the head and neck and the fine carriage obscures the cat hams, the flat sides and bad legs. It is out of the sore experience of some wise old man sprang the epigram about the horse, "No legs, no horse." The breeders of fancy pigs looked to the straight sides, fleshy shoulders and well-rounded hams for market pork and forgot that meat and fat must be held up by bone; so the bone of well bred pigs is often too light.

Legs.

I have had fancy prize winners purchased at the fair. Well, when they grew up the leg bones proved weak and the boar walked on the last joint of his hind legs instead of his feet. I am uncertain what the correct name of this joint is in a pig leg, but in a horse it is the pastern. In buying a young boar look at his toes, he should stand on them firmly, standing forward rather than back. The bone, that is the hock in the horse, should be straight and set straight, for when it is crooked it helps to throw the pig into a position that makes him walk on his pastern after he is aged.

Results.

This becomes a serious trouble as the animals afflicted are unable to walk around the alfalfa fields, and in damp weather chill from want of exercise. These bone troubles have driven the ordinary farmer to prefer sows of common or cold blood. It is also urged that the pure bred sows are often sterile or produce only one or two pigs at a litter. This can be bred out by culling out the defective ones, yet I fear it is rarely done, the breeders selling the sows to the farmer when they prove to be only scant producers.

Usage.

It is common for farmers to use the Berkshire, Jersey, Duroc or Tamworth boar on the grade Poland-China sows, while ordinary cross-breeding of stock is to be condemned, yet as these crosses are practiced for pecuniary returns by a high class of farmers, it should be carefully considered before being condemned.

Reasoning.

This is the way the pig men size the mater up: Berkshire for early maturity—for a pig that will fatten readily at any size or age for market. Jersey-Duroc for large litters. The Poland-China for rustling and large hogs; Tamworth for bacon, streaked evenly with lean and fat.

Strating with common sows is objectionable owing to the mixed type of the pigs, yet it is usually the custom. Now, much of the objection can be overcome by buying the sows from a neighbor who has bred from good sires for two or three generations. The boars can be afterwards depended on to give half their characteristics to the bunch of pigs. If the sows are good breeders hold them as long as they will breed. If the boar proves to hand down his style retain him as well at the head of the swinery. For the young sows from the first mating purchase a second boar. Usually the two sets of sows and boars can be retained for several years profitably. Then the old boars and sows are fattened off for lard, and if there are several will sell well to the local butcher; he needs pure lard for his family trade.—M. E. Sherman.

HOW TO PREVENT HOG CHOLERA.

"Please inform me how hog cholera may be prevented? Last year I had it in my herd of hogs in August of last year," writes a subscriber from Willows.

This is a difficult question to answer. In the first place, the germs of the disease may be brought to your place on the feet of horses, or on wagon tires if the horses and wagon have gone through a lot in which infected hogs have been. There are several ways of getting the disease in a herd, but only one way to treat it after it has gotten hold of the herd. In the first place, clean the yards, sprinkle quicklime generously over the ground to destroy any germs; have only pure water for the hogs to drink, and it is well to put coperas or charcoal in the drinking troughs occasionally, or an ounce of

copper sulphate to ten gallons of water is the rule. Sufficient shelter to ward off exposure to the rays of the hot sun is necessary. Do not allow your hogs to feed on the ground, nor to drink stale surface water. Disinfect the troughs with a 50-per cent solution of carbolic acid once a week. Simply rinse out the troughs, turn them over to dry and all germs will be destroyed. Tar disinfectants may be used also once or twice a week, and the hogs should be sprayed with a one-per cent tar solution at least once a week, especially in hot weather. The water and slop not drank by the hogs should be turned out to prevent wallowing in the troughs. Cleanliness is the best preventative of hog cholera. A herd that is kept clean is much less liable to attack than one which is permitted to wallow in filth.

But when, from any course, hog cholera has manifested itself in the herd in that stage when the excrement is quite fluid or when they are suffering from any derangement of the system which results in a diarrhoea, the following remedy will be found effective: Laudanum, two ounces; spirits of camphor, two ounces; tincture of ginger, four ounces; capsicum, four ounces. Mix well and give one-half teaspoonful for each one hundred pounds of live weight. As soon as the excrement shows signs of thickening, the doses should be reduced to one-quarter teaspoonful for each hundred pounds of live weight.

CREAM VARIATIONS.

The question is frequently asked by dairymen, who use a separator, why it is that cream varies so perceptibly in test in going through the machine.

The Kansas Agricultural College Station answers the question with the following reasons:

1. Changes in the temperature of the milk.
2. Changes in speed of the separator bowl.
3. A variation in the amount of milk run through the separator in a given time.

Los Alamitos Sugar Company

Los Alamitos, Cal.

4. The amount of skim milk or water used to flush the bowl when through separating.

5. Changes in the richness of the milk, either from morning and night's milk or from changes in the lactation period of the cows.

These five conditions will influence the test of the cream, even though the cream screw is not changed. But on the other hand, cream of uniform richness may be obtained from a separator by avoiding, as far as possible, variations in the conditions just mentioned.

A thin cream is obtained by running the separator below the speed, by skimming hot milk, or by crowding the separator, i. e., trying to force milk through the separator too fast; also by using too much skim milk or water to flush out the bowl when through skimming. A thick or rich cream will be obtained when the opposite course is adopted in running the separator.

SEXES OF PIGS.

George M. Rommel, U. S. Bureau of Animal Industry, in response to requests from breeders throughout the country for information regarding the relative proportions of the two sexes of pigs at birth, gives the following as the result of his investigation:

Reports were received from 82 breeders, located in twenty-three States and two Territories (Indian Territory and Oklahoma). Eight breeds were represented as follows: Berkshire, Chester White, Duroc Jersey, Hampshire, Large Yorkshire,

Ohio Improved Chester, Poland China and Tamworth. In a few cases the record of litters of grade and mixed breeding was given; these are included in the results.

The number of sows whose litters were reported was 1477. The number of boar pigs was 6660; the number of sows, 6625; and the total, 13,285. The average per sow was as follows: Boars, 4.51; sows, 4.48; total, 8.99. The figures are mainly for litters farrowed during 1906. In 49 cases second litters during the year were reported for the same sows which somewhat raises the average per sow.

Boars are seen to be slightly more numerous than sows, but for all practical purposes the sexes may be regarded as equal in number at birth. The relative proportion was found to be 1005 boars to 1000 sows. Expressed in another way, the proportion is 100.53 boars to 100 sows, which in lowest terms of whole figures is 201 boars to 200 sows.

If we would only remember that it is easier to keep cows, hogs and horses on the farm well, than to try to cure them after they become sick, we would escape a world of trouble. This may be done by having a sufficient amount of the right kind of feed fed in moderation when the system is in a right condition to receive it; plenty of pure water; given when the animals are not too hot; and then under no circumstances should the animals be overworked.

Feed a good milker a balanced ration. She deserves it.

CANTALOUPE QUALITY.

LESSONS which have been learned by Colorado cantaloupe growers may give a hint to California growers. P. K. Blinn, field agent of the Colorado Experiment Station, writing from there speaks of the evil of green melon shipment as follows:

The reputation of the Rocky Ford cantaloupe was made before the days of large acreages and the shipment of green cantaloupes. It was the uniform, sweet, spicy flavor of the Rocky Fords in contrast with the flat, tasteless cantaloupe of other sections that made the hit on the market and won fame for the Rocky Ford.

The fact that the quality of the Rocky Ford cantaloupes is not so uniformly good as it was a few years ago demands the attention of every grower and commission man who wishes to see the industry continue prosperously.

What Caused It.

Several influences have caused the deterioration of the quality, and some of the elements that impair our cantaloupes are beyond the farmer's control; but the shipment of carelessly packed crates and green cantaloupes and those from badly rusted vines are the chief elements that affect the quality and are certainly within the power of control.

The commission man's experience in handling oranges, lemons, tomatoes, bananas and many other fruits which will ripen to good quality after being picked quite green, leads him to reason that the cantaloupe were not picked green enough when he receives a consignment of overripe cantaloupes and he immediately wires to "get them more green," in spite of the fact that he has experienced melon men to inspect the shipments. Every grower knows, and will admit to himself, that a cantaloupe picked before it is sweet inside will never be a cantaloupe fit to eat.

The Trick.

Without question it is a skillful trick to pick a cantaloupe on the green limit and yet ripe. It is a dangerous line, if growers are picking as green as their judgment tells them, to have a general order given to "pick greener." The result is that nearly every crate has some green cantaloupes in it, and some less critical growers will so far exceed the limit that a large per cent of his crates are too green to ever make edible cantaloupes. And so on the whole, the situation is hard to control with hired help and large acreages. It is strong argument for the small field well tilled and well marketed. The safe line to pick cantaloupes in Colorado is to have them "slip" as it is termed, when the cantaloupe easily separates from the vine. This is nature's first hint that the cantaloupe is sweet inside. If the stem or cantaloupe is broken, the quality has not reached its best and is sure to disappoint the customer. The looks of a cantaloupe and a slight pull on the stem are the tests that a practical man will use. If the melon is showing a tint of yellow it must come off. If it appears as if it ought to slip and yet not yellow the slight pressure on the stem is used, and here is where good judgment is required not to force the slip. The cantaloupe picker that has to pick a lot of green cantaloupes in order to get some just right is of no more value in a cantaloupe field than a tramp with a knife who plugs six or

eight green watermelons to find a ripe one.

Use Sense.

There seems to be too little judgment used at the beginning of the season when growers and commission men are striving to ship the first cantaloupes will ship for nearly a week before there is a ripe cantaloupe. If the growers would pick and pack as if they were the ones who were to consume, the melon's quality would improve to the best possible, and the returns from the cantaloupes would be more satisfactory.—P. K. Blinn.

CABBAGE WORMS.

From the fourth of July through the rest of the season, those who raise cabbages, whether in private gardens or for the market, will notice numbers of white butterflies over the plants. These increase in quantity to the end of the season.

These butterflies are the adults, or parents, of the green worms which eat holes in the leaves of the cabbage plants. They reproduce very rapidly, so that it takes only about a month from the time the butterflies of one generation lay the eggs until the butterflies of the next are flying about. The injury to the plants varies, of course, with the abundance of worms, but often the outer leaves are badly riddled with holes. It must be evident that plants injured in this way cannot produce as large or as good heads as uninjured plants, for the nourishment which forms the heads must be worked over in the green surface of the outer leaves before it is stored.

Remedy.

The best time to combat this pest, according to Professor Johnson of the Colorado Agricultural College, is when the injury first appears and the heads are small or not yet beginning to form. If they are thoroughly sprayed at this time, the early broods will be largely destroyed and the later injury will be less serious.

Perhaps the simplest remedy is Paris green. Mix this in water at the rate of one pound to a hundred gallons of water, or a half ounce in a three-gallon pail and apply with a spray pump. Arsenate of lead may be used for the same purpose by making the dose two or three times as strong as for Paris green.

As we all know, water rolls off very rapidly from cabbage leaves, so it will be necessary to use some substance to make the poison stick. For small garden patches the most convenient substance is soap. Dissolve this in hot water and add it to the poison solution at the rate of about one ounce to each gallon.

For large areas by far the best sticker is made in the following way: In one gallon of water put two pounds of resin; add to this one pound of potash lye; boil the mixture for one or two hours until the resin is all dissolved and the liquor is a clear coffee color. The odor from this boiling substance is very disagreeable and it is better to do this work where plenty of fresh air may be had. This quantity of materials will be sufficient for fifty gallons of the poison solution.

The Pump.

On small gardens a bucket pump will be sufficient to do the spraying. For a few plants, an old whisk broom may be used. On large trees some form of spray apparatus which will permit of using a barrel or more of

solution at a time will be necessary. This may be a barrel and pump which can be carried in a wagon with a hose attached, or a barrel and pump can be rigged on a pair of old cultivation wheels, with four short hoses attached and arranged on a framework so that each one of the nozzles will come directly over a row of cabbages. The driver walks behind and works a pump, thus spraying four rows at a time he crosses the field.

In this work we must remember that we are using poisons, and carelessness cannot be winked at. The edible part of the cabbage is formed within and the Paris green has no opportunity to reach it. These remedies have been used in this manner in many localities and a case of poisoning of either man or beast is yet to be reported.—S. Arthur Johnson.

Don't spread manure with a fork. Use a manure spreader.

Get out of the rut. Many a man who gets out helps some one else get out, too. An example is worth something.

There are times when the farm telephone has great value. If we only had the parcel post, what a saving of time to the busy farmer!

Plan your work and work your plans.

Saturate a sponge or cloth with linseed oil, and go over the surface of the rig after washing it. It removes mud stains and spots, giving the rig a gloss and appearance like a new vehicle.

Kind Gentleman—Young man, do you think you can ever save anything by smoking?

Small Boy—Why, cert; I save dollar coupons.—(Chicago Journal).

The Ornamental Garden

THE SALVIA.

SALVIA is a large and widely distributed genus of plants, including annual and biennial, perennial herbaceous and evergreen species. The salvia has been found in various parts of Europe, Asia, Africa and America, some of the most ornamental species being natives of South and Central America. A number of the herbaceous species have been cultivated in Victoria, many of which were insignificant as ornamental plants, while others, as *S. azurea* and *patens*, are, on account of the beautiful shades of color of their flowers, most worthy subjects.

The most popular salvia cultivated here is "Bonfire," a garden variety specially valuable for its display of bright scarlet flowers during the summer and autumn months. "Gloire de Stugdardt" closely resembles "Bonfire," being somewhat heavier in type of flower and habit of growth. Either kind is valuable for decoration of mixed groups or for bedding purposes.

pots or boxes of soil placed in a cold frame will bloom during autumn.

S. azurea produces plants of a pale blue color, and will thrive under ordinary border treatment in almost any kind of soil. The habit of growth is loose and straggling, the plants requiring to be staked and trained as growth advances. Propagation is effected by divisions of the crowns in spring, the plants producing sucker-like growths like a chrysanthemum.

In many gardens salvias "Bonfire" and "Gloire de Stugdardt" are treated as annuals, young plants being raised each season from seeds. The plants seed freely during the summer, and this method is undoubtedly the easiest. Seed should be sown for early planting in heated frames, for later in cold frames. The plants are cut down by frost in winter unless protected. In the various metropolitan plant nurseries, thousands of young plants are propagated each spring from cuttings taken from plants that have been grown in glass houses during the

Acres of Roses
A Scene in the Nurseries of the Fancher Creek Nursery Co., Fresno

The flowers do not last long on the bushes, but the calyx, which is about half an inch in length, is also bright scarlet, and lasts for a considerable time. There are several other shrubby kinds that are worthy of a place in the garden, being free blooming plants, and of easy culture. The common sage, *S. officinalis*, is a member of this genus, and is not more hardy than several varieties grown for their flowers.

Culture—Propagation—Varieties.

Most of the salvias will grow into bushes from 3 to 5 feet in height, and flower well in any garden soil. "Bonfire" may be seen growing in the public gardens and nurseries in any part of the metropolitan district, thriving splendidly in the most widely different soils. If the plants are given a fair amount of water during the summer, and are sheltered from devastating winds, they will grow practically anywhere.

S. patens requires a cooler and more shaded position to attain perfection than any other kinds. It is one of the most beautiful of the genus, producing spikes of bright blue flowers. The variety is tuberous rooting and is propagated by divisions of the tuberous roots in spring, or from cuttings of the young shoots in a hot house or cold bed frame. It produces seed freely and young plants raised in spring in

winter months. The plants are watered sparingly during winter, and are placed in heat and started into growth early in spring. Cuttings of the young growths about 2 inches long are inserted in sandy soil and root readily, after which they are potted and kept growing, and gradually hardened preparatory to being planted out in October and November. Such plants will bloom early in summer, successive plantings till early in January ensuring an abundance of bright flowers until winter. In places where frost is not severe the old plants will survive and break into growth near the base in spring. They may be pruned back to the young growths, and will make large plants during the summer, but on the whole, young plants each season, whether from seeds or cuttings, are more satisfactory. Other shrubby kinds worthy of culture are:—Bethelli, bright rosy pink flowers, tipped with white; Bruanti, scarlet; Hoveyi, dark purplish blue; Grahams, purpurea purplish crimson; Rutilans, majenta; and Splendens, scarlet. These are evergreen shrubs that may be propagated from cuttings inserted in sandy soil in autumn.—Journal of Agriculture of Victoria.

It must be borne in mind that the above was written for the antipodes. In Victoria, October and November is spring with us and the "successive plantings till early in January" which means midsummer, should in California be in early July.

KEEP UP THE STREET TREES.

J. H. Reed, the veteran tree warden of Riverside, has this advice to give the people of his city, but it applies so well to all sections that we take the liberty of quoting it.

Pepper Trees Need Attention.

In several parts of the city some of the older pepper trees look thin and pale in foliage. In most cases this may be remedied by thorough investigation.

Dig up the earth as far around as pavements or roadways will allow; make trenches as deep as practicable; fill frequently for weeks if need be and the foliage will soon begin to brighten.

It must be remembered that the feeding roots to be reached by the water extend as far out as the branches of the tree, and the water must be gotten to them in some way. But whatever the cost, it will be infinitely less than the value of the tree.

Irrigating Young Trees.

Sometimes young trees are irrigated by putting water on the surface. This is as likely to do harm as good. The moisture goes into the air instead of to the roots and leaves a hard surface if not cultivated. Make a trench around the tree some distance from it. Make it as deep as the roots of the tree will allow. Fill it two or three times. As soon as the water disappears the last time, cover the wet part with a light mulch of some kind, dry grass, dust from the road, old sacking, anything to stop evaporation, and the water goes to the roots where needed.

When the surface is dry enough to work without packing, cultivate

Help the Horse

No article is more useful about the stable than Mica Axle Grease. Put a little on the spindles before you "hook up"—it will help the horse, and bring the load home quicker.

MICA AXLE GREASE

wears well—better than any other grease. Coats the axle with a hard, smooth surface of powdered mica which reduces friction. Ask the dealer for Mica Axle Grease.

H. R. Johns - Sebastopol California

It is wonderful how inexpensively a street may be made attractive with a little enthusiasm, co-operation and work that is really pleasant in itself

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

Bees and Their Care

APIS MILLIPICA GERMANCIA.

The Swiss beekeepers who, by the way, cultivate the bee scientifically as few people do elsewhere, were lately given a chance to indicate their individual preference for any one of the various races among them by voting for it. And here is how they voted: 76 per cent of their number favored the German bee; 6 per cent the Krainer; 3 per cent the Italians and 15 per cent hybrids. About 4000 votes were cast.

Seventy-six per cent favoring the little brown bee as against the aristocrats and patricians of the genera, looks like what in this country is sometimes referred to as "the ignorant vote." The contrary, however, is the fact in this case.

Soon after Dzierzon had introduced the Italians into his fatherland by distributing home-bred queens of his own rearing to friends and acquaintances, and their beauty, gentleness, and industry has thus become known, a mild sort of an Italian bee boom set in. Everybody wanted to know more about them, and many wanted queens. And as their wants were supplied a still more general knowledge of them thus spread, increased the demand still more. And, of course, the increase of the yellow bee translated itself into a decrease for the brown one. Moreover, the good points of this foreign importation stimulated research for possible still better material. The coasts of Africa, the islands of the Mediterranean, Egypt, Syria, the Caucasus, Siberia—competent men traveled through all those countries, singly and simply in quest of native bees. They sent home what they found. Good, bad and indifferent. But all were given a chance, and breeding and multiplying went on in great style and with it all the little brown bee became very nearly extinct.

Very nearly, yes. But high up in the mountains of the country of William Tell there dwells a people whose very local environment offers an almost unconquerable obstacle to what goes by the name of modern progress. Railroads can't run up the Matterhorn, don't you know, nor automobiles approach the icy roles of the Jungfrau very close—not yet. And in the pockets and glens and wrinkles of those towering mountain giants the German bee found her haven of refuge, and of survival.

As everything eventually becomes known by its own inherent virtues and character, so the yellow bee. The first glamor and the enthusiasm wore away in time. The sober judgment, begotten of experience, still acknowledged her many good points; but she had ceased to be the only one. And that, mainly, because the German bee had become discovered, or rediscovered in the meantime.

Not so many years ago it became known to some of the officers of the beekeepers' society of Switzerland that some one living in an out of the way place among the Alps had some extraordinary bees. The party was found, the bees inspected and bought for the society. They proved to be the brown variety, of extraordinary purity. They were given a first-class character at the sale, and they lived up to it afterwards. Searching parties were sent out to find some more of them; and they found some and with the stock thus gathered mating stations were established; more than

ordinary care being taken to have them as isolated as possible. And then queen rearing was undertaken. The experts in charge bred thousands and thousands of them, but only the best and purest of them were retained, and eventually distributed among the members of the society.

That happened several years ago, not over ten at the most, and the votes cast as mentioned above is the concrete judgment of the performances of the bee in question since that date.

As it appears at this distance the brown bee would seem to be above all a comb honey bee. They do not swarm any more than Italians, they are as gentle and prolific, and now comes their main point: They cap their combs snow white. They are hardy, disease-resisting, and very good workers even on scant pasture.

—Henry E. Horn.

NOTES ON BEEKEEPING.

Persons of irregular habits, afraid of too much work, careless or unkind, would better not undertake the bee business, or handling live things of any kind.

Let no man undertake beekeeping thinking that it is an easy task. Beekeeping is like growing a crop. It takes care and labor to make it succeed.

There are still some who argue that the most money for them is in old ideas, old methods, and common bees. They regard the new as too expensive. The best beekeepers and those who make the most money use up-to-date methods.

Those who are in the bee business because there is money in it are not as apt to succeed as those who are in also because they are fond of bees and their care. It takes a fondness for a business to obtain its best success.

Since the coming of alfalfa, any section of the country where it is grown to good advantage is well adapted to beekeeping. Beekeepers say that each colony ought to average from \$3.00 to \$5.00 worth of honey every year besides the swarms which come off.

Some localities are very much better for honey than others. Southern California and Southern Texas are among the best countries in the world. Intelligence, industry and a good location are necessary to the best results.

Bees and insects are exceedingly interesting and useful in carrying pollen from flower to another of the same species. The busy insects seem made for each other. They are after food to eat and nectar for winter food. While hunting these, a large number of flowers are visited and the fertilizing pollen distributed.

California has the name of being one of the greatest bee countries in the world. It is a land of fruits and flowers, giving bees blossoms and shade. In 1857 the bee industry was commenced there. Honey sold at \$1 and \$2 per pound and bees as high as \$100 a swarm. Now there is a good business carried on there, with honey at 6 cents a pound and bees at \$3 a swarm.—Inland Farmer.

With the Citrus Growers

GREEN MANURING CROPS.

THIS is the time of the year to make plans for getting in the green manuring crops. The experience of the past season has made the growers hesitate about planting vetch, peas or any other green crop coming season. The rains stopped coming at the latter end of March and many growers were caught with a heavy crop of green stuff and ground. With this condition came cut worms that attacked the green stuff wherever green stuff was growing in the orchards. In some cases the ripe fruit was badly damaged, the worms having bored holes in a large percentage. This was the limit of some of the growers and the green crops got the blame for all the trouble. It is true, that green manure crops attracted the worms, but when they been plowed under at the proper time, no worms would have shown up. This was demonstrated in many places where the crops were plowed under before the last of March. In such places no worms appeared, even in districts they were most numerous. However, many sections were too wet for early plowing but had that been plowed as soon after the last rains as possible, no trouble would have occurred.

Plow Under Early.

Early plowing-under is desirable for many reasons. The most important is that it allows the grower to get his land in fine tilth before the spring rains are over. A few rains after the last plowing fills the soil with water to its utmost capacity without the disadvantage of having some of it used by the green crops. It makes a more complete decomposition of the material and hence a more quickly available source of plant food. That which lies in the ground in an uncomposed state is of no immediate use to the trees and does not do so much to the ideal physical condition of the soil as when it is thoroughly decomposed. Early plowing-under obviates and difficulties that might arise from worms or excessive water. It insures good tilth at the best possible conditions for good care.

Don't Drop It.

Growers must not lose sight of the fact that humus is the life of the soil and the best and cheapest method of getting humus into the soil is to grow it in with legumes. Many growers will not plant green crops because of the two difficulties that the last spring on account of late plowing, but they should benefit by their experience and not be drawn into repeating an essential practice. It is not necessary nor advisable to plant green manuring crops every year, but a certain amount should be grown. Three years out of five is better than none at all.

Which Best.

Canada peas were almost exclusively grown until within a few years. For the past three years the winter vetch has largely increased in use and is now the favorite crop for this purpose. It has the advantage of standing the winter cold and retaining its succulency for a longer period, thus rendering it more easily decomposed after plowing under.

Season For Planting.

Planting should be done early in the fall so that the crop will make as much growth as possible before the cold weather comes. While it

is true that peas and vetch will grow all during the winter, they will make much faster headway when the weather is warm. If early plowing is to be done, this growth must be largely made during the fall and winter. September is none too early for planting. The station at Pomona demonstrated one season that lupins planted the first of October made more than four times as much weight of green stuff than did the same varieties when planted four weeks later. The early sown plants made a faster growth throughout the entire season than did the later sown seed. That sown first sprouted several days sooner after planting than did the late sown.

After the September irrigation, cultivate the soil and plant the seed as soon as possible after the water has been turned off.

Method of Planting.

Cultivate thoroughly as soon as the land is dry enough to handle after irrigation and sow about forty pounds of vetch per acre, or if Canada peas are used, plant sixty pounds. These should be drilled in about three inches deep and the ground furrowed out immediately. An attachment used by many growers consists of a four by four timber with two bull tongue furrowing-out shovels clamped at proper distance, and this attached to the frame of the drill. The shovels should be placed so that four drill standards come between them, and the drill having eight standards will leave two outside of each furrow. The next round of the drill will bring four rows between each furrow and the next. By placing the furrowing-out shovels properly none of the seed is uncovered, they following between the rows. This leaves the orchard in shape to irrigate as soon as necessary, no further furrowing-out or cultivating being necessary till plowing time.

Inoculation of Soil and Seed.

This is an important item, but the necessity of doing it artificially has been greatly overestimated in the past. While exceedingly satisfactory results have followed this work, after the second year land which has been artificially inoculated and that which has not, show little or no difference in the growth of green crops. This is because the soil becomes inoculated with the nitrogen-gathering bacteria naturally. This almost invariably happens at the latter part of the first year if not before and if the same legumes are planted on the same land two years successively, there is always an abundance of bacteria in the soil. If it is desirable to plant a variety of legume on land where it has never grown before, the soil and seed may easily be inoculated by taking soil from a field where the same class of plants have grown the previous year, and mixing it with the seed before planting. In taking the soil, remove three or four inches from the surface and take the soil just beneath that. Moisten the seed by dipping in clear water and mix a couple of shovels full of the soil with a sack full of seed. Enough of the inoculated soil will stick to the seed to inoculate it.

The liquid in which the artificial inoculating material is grown, is charged with elements that are in themselves a fertilizer, and part of the increased growth obtained by using the medium, is due to this fertilizing element.

A FINE RANCH HOUSE.

Realizing the necessity for a home for the many men and women who are employed on the ranch, the Leffingwell Rancho (Inc.) has just finished and opened to public gaze the finest ranch house for the use of those who labor in the capacity of ranch hands that can be found in the State of California.

This ranch came into the hands of C. W. Leffingwell, Jr., eleven years ago. There are in the lemon and orange and walnut lands 500 acres and in addition to this there has been added 264 acres for grain.

Seven years ago F. W. Gray became foreman of the estate. Today the Leffingwells employ 100 men. About one-half this number are Japanese, who have a colony of their own and do not live with the Americans, who will occupy the new ranch house.

One year ago C. W. Leffingwell, Sr., thought it advisable to incorporate and increase the capital stock to \$500,000, and it was accordingly done. Then it was determined to make the property one of the best equipped properties in California. To this end immense barns were erected and all the latest machinery was procured, and the last thing to be done was the completion of the ranch house that has just been inspected by hundreds of people from all over this section of the country.

The packing-house used for receiving, washing and curing and packing the fruit has been gradually enlarged from a building 30x50 in 1897 to the most complete lemon packing plant in the State, which has now 36,368 square feet of floor space. The equipment is of the best and most modern. Two Steubner's immersed lemon washers with a capacity of three cars per day, a box-making department and ample curing rooms. The whole house is lighted by electricity and the machinery is operated by electric motors. At present an output of 150 to 175 cars per year is being handled.—Examiner.

BEST OF FARM PAPERS.

"I am much pleased with the varied reading matter in the Cultivator. Its practical articles pertaining to everything on the farm and its varied and excellent illustrations, make it the best of the four farm papers which I take.—Jacob Koenig, Lodi, California.

He (11:30 P. M.)—I'm not going until you admit that you love me.

FARMERS' INSTITUTES.

Conductor Neff writes that owing to the fact that the State Farmers' Institute which is to be held at the State Farm at Davis on Oct. 29, 30 and 31, the dates which were announced in the Cultivator a couple of weeks since, have been changed and now the following will prevail:

San Miguel, Oct. 14; Santa Maria, Oct. 15-16; Lompoc, Oct. 18-19.

BENEFITS OF THE PURE FOOD LAW.

Dr. Wiley, specialist of the Department of Agriculture, says, as a result of the pure food law, he expects to live to be 100 years old.

"I believe the pure food law will bring untold blessings on future generations, and we will all live to see man's term of life extended through its benefits," he continued.

"It is the one law that has made radical changes against which no suit to annul has been brought. This is due to the moral sentiment back of it. No business man would dare to try to have it set aside, because it would mean his commercial ruin."

In the matter of pure food drugs alone, the law will result in vast benefit to the people. Manufacturers of medicine are required to print the formula on the label, to the end that the consumer may know what he is taking. For example: Headache tablets are now labeled plainly to prevent the possibility of error in their use. The idea of making the labels explain the exact nature of the chief principle in a medicine,

the dangers of an overdose, and of making its use a habit, would make the pure food law really useful to the public. The same rule holds good in other combinations of medicine and in stock foods which is certainly a blessing to animals. On the whole, the law is one of honest merit.

RESTORATION OF THE FORESTS.

The coming to California of Gifford Pinchot, chief forester of the Department of Agriculture, will do much to awaken public sentiment on the subject of the restoration of our forests. He is an enthusiast on the subject of tree planting, because he realizes the immense need of forest restoration if we are to have any timber in this country for future use. The truth is, we have about exhausted our timber domain. On the Pacific Coast in the south and on the Lake States, we have ruthlessly devastated the forests and done nothing to rebuild the waste places.

What is true of the United States is also true in great measure of Canada. One thing is certain, we cannot go on eternally using up our natural resources in an extravagant manner without some day coming to the halting place. The devastation has been great in every way. The sea has been robbed of its treasures, the land has been mistreated in many sections until it will no longer produce the bountiful crops it once did (but thanks to a knowledge of how to restore it, the soil is being made fertile again.) Now we are also told that the supply of anthracite coal will only last 75 years longer. But none of these products equals in importance that of timber. In fact, nearly all of them are dependent on trees for sustenance. This is particularly true of the soil. Without trees the water supply will diminish, and water is one of the chief essentials in every farming community. The wheels of nearly every industry will stop when the supply of lumber is exhausted, if that time is ever permitted to come.

The necessity for restoration effort has not begun any too soon and it is well that our government senses the situation and has turned its attention to this stupendous task. But the government alone cannot restore the forests. State authorities must assist, and behind both these powers must be the common people ready and willing to assist. It requires the co-operation of every man, woman and child in the entire nation. The trusts and money kings are mostly to blame for the condition that confronts the country, but it is useless to expect aid from them. They have made their fortunes from the forests and it is not likely that they will lift their fingers to help replace them.

But the forests can be replaced, and the next quarter of a century will witness millions of acres of trees growing on lands today denuded and bare. Let us hold up the hands of the forestry bureau, and if such representations of Gifford Pinchot, for in this direction must we look for relief and for assistance in reforesting our treeless domain.

ADVERTISING MEDIUMS.

Advertisers are quick to comprehend the relative value of advertising mediums.

The daily paper has certain lines where results are obtained over weeklies, but they are few. Commercial houses, for instance, in large cities, use the dailies to obtain quick results on lines of goods sought to be disposed of quickly. But it is found that such advertising is only local in its effect and has no permanent value. The public does little but glance over the dailies and seldom retains in mind what they say; they are too big and it takes too much time to go through them. They are hurriedly scanned, thrown down and never referred to again, unless something of more than passing interest is in question.

Not so with the weekly newspaper or magazine. The rule is, that a good weekly is read by every member of the family, advertisements and all. Usually Sunday is the day for reading the weekly paper and, as it is read more carefully, its contents are more thoroughly understood and remembered. Then, too, there is more attention paid to advertisements in the weeklies by the owners, they are selected with greater care, all doubtful ads being refused and only such as are genuine being admitted to their columns. For

this reason the weekly magazine is looked upon as the more reliable medium for advertisers.

The daily has its legitimate field, viz., the giving of the current news, but the weekly combines this feature as well, and has the further advantage of more careful selection of reading matter; for there is not the hurry there is with the daily and, therefore, greater care is exercised over what goes into its columns.

Some of the most successful merchants in the country has produced have given their opinion that for results the weekly newspaper excels the daily. A. T. Stewart was one of these, and as he gave the subject very considerable thought and noted results specifically, his judgment may be accepted as worth a great deal to the advertisers in general.

Among farmers a weekly magazine, of the character of the Cultivator is pre-eminently superior to any other class of papers for advertising purposes. It is read by 25,000 men and women every week, what it states is accepted as true and it is expected of the advertiser that what he states concerning the matters he represents, the goods he offers and the prices he asks, shall be right. The Cultivator will not knowingly add to its columns a fraud, nor a scheme devised to defraud, hence its value to those having legitimate offerings in any line that interests the farmer.

The value of the Cultivator columns lays in the care taken to exclude all objectionable matter of whatever character, and we feel that we can safely say to our readers that whatever appears in the paper may be relied on as genuine. Because of this care and our large circulation, we may frankly say there is no weekly magazine in California superior to the Cultivator as a medium for reaching the general farming class.

DESECRATION OF NATURE.

The Cultivator has been preaching sermon for years against the practice of erecting billboards for advertising purposes on vacant lots in town, on public highways and on railway lines as the most flagrant desecration against the beauty of nature which the imagination of man can invent.

We are glad to note that the agricultural press generally, is condemning the hideous practice as monstrous in the extreme. Among the strongest journals of its kind to call attention to this matter is Farm, Stock and Home, which, in a recent number, calls for legislative enactment to compel a discontinuance of the practice. This paper cites the fact that the German government will not allow its streets to be disfigured, and even regulates the character of works of architecture and sculpture erected along its city squares and streets, instead of allowing them to be marred by the cupidity, whims or bad taste of property owners, and has for some years protected the best sites from misuse or depravation. Prussia goes yet further, and a bill recently passed by its Parliament provides against anything in the way of buildings or advertising placards which tends to destroy the beauty of mountain scenery, which, it is said, "will restore to their primitive beauty many landscapes whose finest features have been desecrated by the erection of unsightly billboards."

"Americans have thus far been too much absorbed in the chase of the almighty dollar," says Farm, Stock and Home, "too intent on developing the great commercial resources of our country, apparently, to give much thought to preserving its equally great natural beauties until within a comparatively few recent years when the public has been moved to demand that steps be taken to preserve Niagara Falls from threatened ultimate destruction by commercial vandals, and the setting aside of the valley of the Yellowstone for a national park."

California is the greatest sufferer from billboard nuisance we know of. Its very prettiest locations are made ridiculous by the appearance of unsightly real estate signs and other displays which destroy all the scenic beauty nature bestowed upon the country. The town and county

The Santa Fe railroad company gave a train of six Pullmans and a diner free to representatives of the Corcoran beet sugar factory last week. About 200 availed themselves of the opportunity to see the country around Corcoran and Visalia. Railroads sometimes do big things when developments of a district is in issue. Hon. Nathan Cole, Jr., president of the Visalia Beet Sugar Factory, was the central figure of the enterprise. "He is doing a great work for the farmers of Kings and Tulare counties," writes a leading citizen of that district to the Cultivator.

Agricultural Notes of the Pacific Coast

Northern California

Yuba county is growing tobacco successfully.

Mildew will affect the Sonoma county grape crop.

Work in gathering beets at Chico began August 27th.

Yuba city is forwarding a carload of seedless grapes daily.

Fig packing has begun in the packing houses in Yuba city.

A new creamery has been established at Meridian, Sutter county.

Hops in Sonoma county while not so large a crop as last year, will average fair.

"The hop crop rather below the average," is the report of a large hop buyer.

Sutter county prune crop will be excellent and some growers will net \$400 per acre.

Wheatlands finds she has to depend upon Indians for the larger part of her hop picking.

Willows has a hen which has now been setting for three months and is still well and happy.

Sacramento valley pears are selling in the East at two for fifteen cents or four for a quarter.

A Southern cotton grower who now resides in Chico, says that that section has the possibility of producing fine cotton.

Planting of beets in the Chico district section will begin much earlier next year so that the next crop may ripen as early as July.

Agriculturists and miners are having trouble over the operation of dredgers so as to destroy much valuable land along Butte Creek.

"The country here is prosperous and crops good," is written the Cultivator by its field representative, Williamson, who is in Sonoma county.

Marysville people are taking steps for the entertainment of the State Fruit Growers' Convention to be held in that city in September.

Colusa county Chamber of Commerce is exhibiting "a golden rind" watermelon, in appearance much like the cantaloupe and of similar size.

Ten dredgers are at work in one section of Pearson district on the lower Sacramento river on strengthening the levees for the next flood season.

Members of the Sonoma county co-operative Association claim that wift & Connay are interpreting a contract with producers so that wift gets all the advantage of the deal.

The election on the question of bonding the city of Oroville for the purpose of raising money to build stronger levees between the City of Feather river carried by a big majority.

The Board of Supervisors of Tehama county is to sell 12,525 town lots which were sold to the county or taxes at the rate of ten cents a piece. They are used as a sheep range at present.

A dispatch in the Union from Stockton says that much annoyance and loss has been caused to fruit growers by the White Fly which is infesting many local orchards. We think it a case of "hot air" reporting.

Central California

Stockton is to ship some grapes under the pre-cooling process.

Pajaro valley will ship twelve hundred cars of apples this year.

Green fruit shippers are promised an abundance of cars in a short time to relieve the congestion.

One Modesto melon grower grew \$400 worth of cantaloupes from four acres of land.

Santa Cruz county is urging Monterey and Santa Clara to assist in road building.

The Modesto Herald reports exceptionally fine peaches grown in that section this year.

The west side of San Joaquin valley yield of barley is proving far better than anticipated.

Kern city competed with Bakersfield in a mule race on Admission Day, and "Maud" had the time of her life.

The effort of San Francisco to tap the Tuolumne river is bringing on a pretty fight with the Turlock-Modesto Irrigation people.

Tulare Register reports a fruit grower's success with cantaloupes in which he paid for his land twice over in one year's crop.

Exeter is making efforts to pick her raisin grapes with "home-grown talent." Boys and girls are given work in preference to Japs.

Apples suitable for drying purposes, generally culls, windfalls and all those not suitable for shipping are bringing \$12.50 per ton in Watsonville.

Fruit growers of Exeter have formed a Fruit Growers' Protective Association and are serving notices that trespassors will be punished.

A fruit company at Visalia received as returns for two carloads of peaches sold in Philadelphia on the 19th, over \$4600 for the two cars.

Frederick Maskew reports the work of fumigation on White Fly at Marysville thoroughly done and believe that practically all the White Fly have been killed.

A new cannery is nearing completion at Watsonville. It is the property of the Pajaro Packing Co. Its work this fall will be principally upon apples.

San Jose has a station established by the Entomological Division of the Department of Agriculture, for the investigation of orchard insect pests. Dudley Moulton is in charge.

Exeter, which claims to be the home of the McKevitt peach, also claims a new grape produced there to be one of the finest. It is grown from the seed of the Muscat.

E. K. Carnes has finished the white fly campaign at Bakersfield and is again in Marysville. Mr. Strong, of Los Angeles, has been left in charge of the Bakersfield campaign.

Government Inspector Peary, is investigating conditions near Hollister and looking into the advisability of creating a forest reserve of approximately two hundred and fifty thousand acres.

The \$12 price of wine grapes established by the California Wine Association, does not seem to stick, for much better prices are being reported in the press of the State. One Lodi paper reports one grower selling at \$21 per ton.

Southern California

"Walnuts are dropping badly" is the report from Anaheim.

Wells are being sunk in Yucaipa valley to develop water for irrigation.

The demand for feed will be great in Imperial valley this fall says the Standard.

"The supply of dairy cattle is not up to the demand," is the cry of Imperial valley people.

Orange county is reported to be overrun with coyotes, and the Supervisors are urged to offer a bounty.

Santa Ana people in their efforts to secure the beet sugar factory have raised \$50,000 of the \$100,000 bonus demanded.

R. L. Lewis of Hemet has sold his ten tons of honey at six cents a pound. F. S. Church sold his honey at the same price.

A large quantity of Bartlett pears for table use have been shipped from Hemet the last two weeks. They are of very fine quality.

Farmers near Anaheim recently united in having a little colt show all of their own. Some very fine Belgians were exhibited.

The papers of Orange county report that W. S. Woglum, expert and special agent of the Bureau of Entomology, says that the White Fly will not exist.

Representatives of the cabbage and celery men are on a trip to the East to appear before the Interstate Commerce Commission in an appeal for lower rates.

Packing houses are ready for handling the new crop of walnuts which it is said will begin forwarding about Sept. 15th. The crop will be fair and prices good.

The Crafton Orange Growers' Association has become part of the Redlands Golden Orange Association. By this act the Golden becomes the largest individual association in the State of California. She will ship about 800 cars.

The water companies in Imperial valley are preparing for a great increase in demand for water during the coming season, as the feeling of security given by the construction of the levees, is such that a large influx of labor and capital is expected.

Prunes are bringing four cents bag basis. The trees are heavily loaded at Banning. There is an immense crop of grapes of all varieties—wine, table and raisin. At Banning, green fruit shippers are offering three cents a pound for Tokays and Emperor on the vines.

Mrs. Martha Ludin, of Hemet, had several red tomato plants and one plant of small pear-shaped yellow tomatoes growing near a flower bed in her yard last season. This year, she has one vine bearing small red pear-shaped tomatoes and several vines with large round yellow tomatoes. She lays the coincidence to the humming birds and bees that hovered over the vines last year.

The Claremont Pomological Club holds its annual picnic in Genesha Park, Pomona, the last Monday of the month, September 30. Dr. G. S. Summer will give an address on the agriculture of Australia and New Zealand. It is hoped and expected that Prof. Ralph Smith, of the Whittier station will talk of citrus diseases. County division will be ably discussed pro and con. Everybody is most cordially invited.

The Coast

A mid-summer hail storm did considerable damage to the crops around Ashland, Oregon.

The creamery at Corvallis pays for nearly ninety thousand pounds of butterfat a month.

Clackamas, Oregon County Fair, will be held at Glarstone October 10th, 10th, 11th and 12th.

Twenty thousand boxes of early Crawford peaches were shipped from Roseburg this season.

Portland quotations for the best creamery butter is thirty-five to thirty-seven and one-half cents.

Steers are quoted in Portland at \$3.50 to \$4.10; hogs, \$6.75 to \$7.00; sheep, \$4.25 to \$4.50; lambs, \$4.50 to \$4.75.

The Oregon State Horticultural Society at its recent meeting at Medford had extensive discussions as to cover crops.

Prof. Scudder formerly of the Kansas Agricultural College, has been elected Agronomy at Oregon Agricultural College.

The Oregon Agriculturist maintains that the apple growers of Northern Pacific Coast are about the most progressive of the country.

Most of the fairs in both Washington and Oregon have taken an advanced stand in prohibiting pool selling and gambling this year.

Fruit around Medford in Southern Oregon is said to be exceedingly fine this year. Pears have been netting the grower \$2 and \$2.75 per box.

While the fruit of North-central Washington is not great in quantity it is claimed some of the finest quality of fruit is put out in that section.

One dollar is being offered the Dayton, Wash., barley growers. The output of that section will be about eight hundred thousand sacks.

Heavy rains in Washington and Oregon stopped harvesting operations for a short time, but later sunshine caused the busy hum to begin.

Convicts at the Washington State Penitentiary manufactured during the past year one-half million grain sacks which aggregate in value nearly \$46,000.

A poultry association has been organized at Cottage Grove, Oregon, in order to promote the poultry industry in South Lane and North Douglas counties.

The Spokesman-Review says that one of the finest yields of grain ever produced in the history of Sherman county is due to a contract with rain-maker Hatfield.

A lawsuit is on at Tacoma because of the destruction of peaches claimed by inspectors to be infested with San Jose scale which the owner maintains he has proof were not infested.

The Spokesman-Review says that farmers of the Pacific Coast will soon have an opportunity to grow a white winter wheat which will be especially adapted to soil and climate conditions.

The State Grange of Washington has declined to take an active part in the promotion of the success of the Interstate Fair held in Spokane. Its reason for this action is the well-founded one that the management of the fair allowing pool selling at the races at the grounds.

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. artificial manure. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

RHODE ISLAND RED.

THE Rhode Island Red fowl may be termed as a bird whose origin is "different." Here we have a bird that was made by out-crossing and as a breed one that was bred longer than any fowl we know of, before we were asked to have it admitted to the standard.

A Farmer's Bird.

It seems that the Red was produced without any definite idea other than to have a red bird, strong, vigorous and at the same time have the practical qualities so much desired by the farmer.

When we say that the Red was originated without a fixed type in mind, we don't want to be credited with saying they were produced by accident, or that the fancier did not have his share in giving us the beautiful and symmetrical bird of today. What we really mean and wish to convey to our readers is that when the fancier's notice was first attracted to them that they found a Red bird, especially in the males, bred generally by the New England farmer and particularly those of Rhode Island.

That so far as type and color were concerned they ran from a Java to a Wyandotte. Specimens were even put in the show room as Buff Rocks and Buff Wyandottes.

A Bit of History.

It is claimed, and the claim is substantiated that they have been bred for 50 years, especially the male, for on most every farm in Rhode Island for a long time the farmer had conceived the idea that red fowls were more vigorous than any other color. So in mating up his flock he always selected to head his pen a red bird, even though his females were mongrels.

The first time we ever heard of them being called the Rhode Island Red was in 1879 or 1880, and is given by Mr. Edward Brown, F. L. S., in his book, "Races of Domestic Poultry." From that book we quote the following:

"At one of the first exhibitions of the South Massachusetts Poultry Association, Mr. Jenney presented some buff birds for entry, a trio alive, and a number dressed, saying that in his judgment they were the coming birds for both eggs and poultry. He was asked what they were called, and replied they had no name. Then some one suggested he give them one. "Well," said he, "suppose we call them Rhode Island Reds;" and so they were entered by that name."

Origin.

Our Rhode Island Reds have in their makeup the blood of some of the best breeds of our domestic fowl. And are the result of crossing, according to Mr. Edward Brown, the Red (partridge) Cochin and the Red Malays, with the ordinary fowl. Later, further crosses were made with Wyandottes and Brown Leghorns. It is apparent that the Asiatic blood predominates and that the Malay has had considerable influence as to the constitutional vigor of the breed.

Color.

The color and shape of a well bred Red, (that is one bred close to standard requirements) is distinctive and will attract attention and admiration from a true fancier whether he breeds them or not, but it is color, however, when the breeder holds a special position. The general surface: color of male is a rich brilliant red, excepting the main tail feathers and wing coverts, free from shafting, mealy appearance or any foreign color. So bright as to have a glossy appearance; the under color should be red or salmon, not whitish or smoky; black or white in under color in any section is undesirable. In general appearance the different sections should harmonize and color shade or vary as little as possible. The tail black or greenish black; coverts black, but may become red as they approach the saddle.

Color of female: General surface color lighter and more even than the male; free from mealy appearance or shafting; of a rich even red, not so bright as the males excepting the tail which should be black and the lower hackle feathers which should have a black ticking, but not a lacing.

Shape.

In shape, the standard of the Red is broad, long and deep. The back should be carried nearly horizontal, with slightly concave sweep to the tail.

Here is where we believe many breeders of the Reds "fall down." They are afraid of getting their birds too long. We prefer as a typical Red the Java shape to the Wyandotte shape. We predict that in the future you will see in the Reds longer and deeper, than they are bred today. Perhaps some breeder of the Reds will take issue with us. If they do, we would like to hear from them, for the Reds are a good breed and will stand up under the discussion.

AROUND THE YARDS.

Whitewash the houses, it is light, sweet and cheap.

See that your hens have no soured food.

At this time of the year many broody hens are allowed in the nests to hatch nothing but lice and mites. They should be taken out of the nests at once and placed in a run where there are no laying hens to bother.

The tourist accosted an old farmer who was standing on the bank of the Niagara river just below the falls.

"Did you ever shoot the rapids?" he asked.

"Naw," replied the old man, "but I took a shot at one 'uv 'em fer runnin' his pesky autermoveel over one uv my chickens, b'gosh!"

Indian Runner ducks are naturally the best egg producers of all ducks. When carefully selected and bred for eggs, have produced in a year from 125 to 180 eggs per duck.

Pekin ducks are quick growing, prolific and best of all for producing the broiler duck at ten weeks of age.

Rouen ducks are considered the best of all for winter roasting, though not so good as egg producers.

Chicken Pox.

Will you kindly tell me what is the

atter with my chickens? The first noticed wrong with them small blisters appeared on their combs. Later, blisters covered their entire heads, causing blindness and finally death. Is the disease contagious and what can I do for those that have it, and how to keep it from spreading?—A content reader.

Your birds have chicken pox; it is contagious and unless you give prompt attention and separate all affected birds from well ones, you cannot rid your flock of it. The cause is chicken flea or mosquito bites.

We are glad to reprint a timely article in this issue by H. O. Hawkins, poultry expert of Victoria, in Journal of Agriculture.

SUMMER CARE OF YOUNG FOWLS

owing to the very late spring many chicks were hatched in June unusual, and the hatching was in many cases extended into July. To rear properly for these late hatched chicks requires much watchfulness to prevent disease from getting a start among them. The use of incubator and brooder insures freedom from lice, but many of us still rely on the hen, and consequently must fight the lice and a number of other pests. A brooder is preferable to the hen in every way. If we depend on the hen there will be chicks cramped to death, chilled to death or possibly some lost or devoured by a neighbor's cat. With a brooder in an inclosed run there are none of these with which to contend and the percentage of chicks brought successfully to maturity will be correspondingly high. If hens must be used, the nests and all surroundings should be kept clean, and every pre-

caution should be used to keep them free from lice.

Food for Rapid Growth.

At this time my yard is full of young stock of every age from three to twelve weeks, and in the brooder yard are others just hatched. All of these last are intended for market and will be brought to the proper size as quickly as possible. They are fed cornbread and finely chopped meat scraps until a week old, then the smaller grains are added, and after the fourth week their principal food is corn, beef scraps and some green stuff. Free range is not advisable for market fowls. They should have no more exercise than absolutely necessary to insure perfect digestion, and failure to provide it will surely cause trouble. I believe that broken china gives more satisfactory results than the grit sold by poultry dealers, and the hens eat it more rapidly. In my yard I placed two boxes of grit, one china, the other commercial, and the china was taken eagerly by the fowls, while the other was not eaten at all until there was no china left.

All young stock not intended for layers or breeders should be disposed of as soon as they reach the proper size. To keep them longer is a useless expense. It is better to sell at once at the prevailing market price, though it may be low, than to wait for higher prices.

Don't Feed Wet Food.

A disease which kills many young chickens during the summer months is bowel trouble. The principal cause is the feeding of wet food. Often more food is given the fowls than eaten later and causes sickness. If

not allowed to go too far before they will eat at once, and in hot weather it soon becomes sour, is treating, bowel trouble can be cured by giving a few doses of ginger to the affected fowl. The best prevention is to feed nothing but dry food.

Lice probably cause more trouble than any of the various diseases; yet the farmers refuse in many cases to heed the advice so often given in regard to cleanliness. Lice thrive in filth, and if the house and premises are kept clean the pests will not remain. A liberal use of whitewash and lime will work wonders, but even these will prove ineffective if the droppings are allowed to accumulate for weeks. Clean the poultry house twice a week in summer, and give plenty of sunshine and fresh air.

Give free range to the young pullets if possible. They will mature in less time than if confined, and before cold weather sets in they should be laying.—Tribune Farmer.

CROP BOUND.

In some cases the contents of the crop are so much compacted that it is next to impossible to soften them by manipulation or by medicines. In that case little else remains to be done but cutting the crop open and removing the mass through the opening thus made, then sewing the wound carefully together with silk thread. In the Rural New Yorker a contributor gives his method of treating a crop-bound fowl as follows, said to be never failing if applied in time:

"Take toilet soap the size of a large pea, dip in water and put in chicken's mouth; immediately give

about four teaspoonfuls of water. Carefully knead the crop until softened. In an hour or two give a teaspoonful of castor oil, or linseed oil (raw) will answer; knead again. Shut the chicken up and leave water for it, keeping all kinds of food from it. Next day, if crop is becoming empty, feed some soft feed with a little grease in it. In a few days it will be well. For young chickens about half the amount.

In many cases, however, it will be practicable to wash the stuff out of the crop. This can be done with a fountain syringe, using warm water or suds, and kneading the crop until the contents are softened and washed out.

A TIDY SUM FOR A GOOD FLOCK

A Farmer correspondent sends the following account of the extra good returns received from a flock of 130 hens, property of a young lady poultrywoman.

During last year 1490 5-6 dozen eggs were produced, which sold for \$384.87. The sales of poultry amounted to \$94.62, making the total receipts \$479.49. The feed bill was \$220.13, leaving \$259.36 net profit, or practically \$2 per hen. Miss Warren did all the work herself, hatching all chicks by hen power. The eggs are sent to Boston to a retail dealer. No breeding stock was sold nor eggs for extra prices. Dry feeding is practiced after the Gowell formula.

This record is an illustration of what a young lady armed with experience and progressive ideas can do with poultry. Some of our poultry keepers of the sterner sex will need to rise early to eclipse this record.—Maine Farmer.

A. C. W.

Stands for Purity and Goodness

In Poultry Foods. A. C. W. Egg Food contains 100 Lbs. to the sack, and this 100 lbs. contains a balanced grain ration based on the analysis of the egg, as follows:

Water	-	650	Grains
Albuminoids		80	"
Oil, Fat, Etc.		135	"
Mineral Matter		9	"
Sugar and Coloring Matter		26	"

The remaining 100 grains of the 1000 are used in the shell, which contains about 50 grains of pure uncombined lime, the remainder being carbonic acid, and water of crystalization, etc.

No Guess Work about A. C. W. Foods. Scientifically **correct** and practically **successful**.

The ideal food for the moulting period, as it contains **no dope or stimulants**, such as fenu greek, antimony or other nostrums.

Try a sack of A. C. W., the **"NATURAL FOOD."** At all dealers or direct from our factory.

Hen Fruit Pays. If you want more, feed

Egg-More

Poultry need to be fed a scientifically balanced ration as much as any other stock. Egg-More is just the thing to mix with good grains to make the same a rightly balanced ration. It is highly nitrogenous, very rich in protein, will keep the hen in good health, sustain her system properly, and enable her to lay lots of eggs when they are scarce and high. Just a little fed daily with good grains, or even with bran, as directed with each package, will do it. It can be fed either dry or as a mash. It contains no cheap filler; the hens like it, they eat it, there is no waste.

Egg-More

Makes the cheapest Egg Food especially if you can buy your grains at home cheaper than to ship them in. Many so-called "poultry foods" and "egg-makers" are nothing but stimulants and not advisable to be fed regularly. Egg-More is not a strong tonic and stimulant, but merely contains enough condiments to give the food relish and keep the fowls in fine fettle. It will pay its cost many times over in the increased egg yield. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

POULTRY RAISING AS A BUSINESS.

Let every farmer carefully estimate the cost, in labor, of the things he produces. He need not put down the sums he expends out of his pocket, but simply endeavor to place a value upon the labor he himself bestows on every department of the farm and upon each crop. If he is a "business man," that is, if he knows what he is doing, by keeping an account of his operations, as every man who is in business does, or should do, he will have no difficulty in classifying the receipts and expenses, and especially the cost of labor. Next let him estimate the space or number of acres he has given to each one of the crops, as well as the plowing, harrowing, hauling, shipping, etc., and charge interest on the capital invested. After he has done this let him take up the poultry, place a value upon the meat and eggs, the cost of the feed, and the labor bestowed—the labor particularly—and then compare the results from the poultry with those from the larger stock and regular crops. He will find that if he had kept more hens, and given them only one-fourth of the care and labor bestowed on other departments of the farm, he would have had a larger balance in his favor.

By looking over statistics he will find that poultry produces more than sheep, and that our enormous wheat crop is not much greater in value, annually, than the products of fowls. With markets always ready, and with cash returns every month in the year from poultry and eggs, the farmer uses the most profitable sources of income as a "side business," and expends his energies over the large areas, being fortunate if he can show profit from each acre at the end of the year, while his fowls, on a few rods or acres, are giving him quick returns, both summer and winter, which he hardly recognizes as belonging to his farming operations. It is to be said in favor of the poultry industry that while panics and financial depressions have occurred several times in the history of this country, the markets have always accepted the supply of poultry and eggs offered and at better prices proportionately than were ruling for other farm products.—Michigan Farmer.

TABLE FOWLS.

Some of the strongest advocates of the keeping of breeds for producing choice table fowls maintain that a fowl should have yellow legs to find favor with buyers, which is partially true, but if some enterprising poultryman would make an attempt to produce choice fowls by using the Games or English breeds and building up a special market for them on quality, he would meet with excellent success, yet the English breeds and nearly all of the Games have legs other than yellow. Where the mistake is made is in the endeavor to select a breed that will prove good layers and also possess all the desirable qualities to a certain extent, yet such breeds as the Games do not rank as the best layers. There will never be a reputation gained by any farmer for extra choice table birds until he is willing to expect fewer eggs from such. What we mean by table fowls are those better than the ordinary market poultry. There is an opening for producing something extra choice, and the prices will be easily secured for such stock on the stalls.—Colman's Rural.

VARY THE FOOD.

Corn and cornmeal are deficient in some respects as egg-producing food. The most difficult work performed by hens that produce eggs is the manufacture of the albumen, or white of the eggs.

The yolk is composed mostly of the elements of food that produce fat, being known as the carbonaceous elements.

In wheat and corn the carbonaceous materials are very abundant, but the substance from which the albumen is derived is lacking in proportion to the yolk-producing materials. For this reason the feeding of fowls on nothing but grain is not conducive to egg-production. The food should, therefore, be varied, lean meat, linseed meal, cut bone and finely-cut clover hay (scaled) to be given in addition to grain. Lime and other mineral elements are also derived from the foods consumed.

Irrigation and Forestry

FARM DRAINAGE.

WE have no means of knowing to what extent underdraining is being practiced by the farmers of this State, but from the fact that it is very seldom mentioned in the agricultural press of the State and almost never made a topic of discussion at farmers' institutes, we infer that there is very little of it. Nevertheless, we are sure that drainage would be profitable on portions of multitudes of farms in those portions of the State in which the rainfall is sufficient to prevent any alkali problem from arising, while in the irrigated districts draining is already a vital necessity. When drainage on a large scale is undertaken the employment of competent engineers is a matter of course and no suggestions as to methods are needed, but in non-irrigated districts the drainage operations will usually consist merely of relieving some depressed portion of a farm from its surplus water and turning it into the natural drainage of the country. In such cases the farmer is likely to be his own engineer and contractor, and until he has learned by costly experience how not to do it he is likely to make a pretty bad job of it. And we are inclined to believe from personal experience that there is more danger of bad work in laying tile than in getting a theoretically true grade. Almost any farmer with an ordinary level—attached to a twelve or sixteen-foot "straight edge"—best—can determine the fall between inlet and outlet for short distances and make some convenient device which will enable him to make the bottom of the ditch on a true grade. The trouble begins when one commences to lay the tile over ground of uneven texture, such as is likely to be found in draining swampy land. From motives of economy the smallest tile adequate for the service will be used and if it settles seriously in some places, while remaining stationary in others, the work will be lost, as silt will deposit in the depressions and the drainage will be stopped. An excellent bulletin of the Wisconsin Experiment Station says: "There are various ways of meeting the difficulty of laying tile through beds of quicksand. One is to extend the tile into the wet area only a few feet at first, and extend it a few more until firm ground is reached. Another way is to support the tile with boards." The same methods would be effective through pockets of peaty or other soft soil. When the tile is laid the problem is to keep the silt out of it. This must be thought of in laying the tile and the ends so joined as to make the tightest possible joints. But the great trouble is at the inlet. About the only way to protect an inlet under firm ground is to surround it with a quantity of small stones—probably a load or more—that all the silt is bound to be deposited before reaching the tile. In the West, where we have so many burrowing rodents, it is necessary to protect the outlet in the same manner or you do not know what you will get into your drain. In any country of rainless summers it is almost useless to lay drains less than three feet deep, so as to be out of the reach of the roots of most cultivated plants. As the soil gets dry the plants hunt for water, and while the small roots which enter the drains die with the plant, they are liable to form the nucleus of a bad

clog. It seems useless to lay tile drains within reach of the roots of trees, for they are almost certain to make trouble. All attempts at sub-irrigation of orchards by means of pipes with orifices seem to have failed from this cause.—E. F. Adams in Chronicle.

FOREST TAXATION.

Taxation is a science in itself, and far too little understood. Its shiftings and incidents lead at times to remarkable results often undreamed of in the philosophy of the authors of the legislation.

In his book, "The Study of Sociology," Mr. Herbert Spencer gives an interesting illustration of the way in which things social and economic act by contraries. He describes the efforts of a novice who, in attempting to hammer out a metallic plate, applies his tool to the salient parts and beats down the places which, to his eye, particularly need to be beaten down. The result, however, is that, before he has proceeded far, the metal has assumed shapes fearful and wonderful to behold, and its last state is, by far, worse than its first.

Mr. Spencer gives this as an illustration of the abortive consequences which usually follow unscientific attempts to effect social and economic results.

History abounds with illustrations of boomerang legislation and administration. In France, under the old regime, experiments in taxation were made which, it is to be hoped, will never be repeated. Taxes were laid on windows, with the result that, to escape them, people boarded up their windows and sat in the dark. Salt was taxed until abstinence from salt menaced the health of the people. In Egypt, date trees were once taxed until the people cut down their trees.

Through discouraging production and possession, to the extent, at times, of actually taxing things out of existence, the enginery of taxation, nominally employed for public ends, has often proved a fearful weapon for social mischief.

Studies, within the last quarter century, on this subject should, by this time, have begun to bear fruit. Much, however, remains to be accomplished, as is proved by the existing condition of forest taxation in the various States. Owners, willing and even anxious to retain their forests, are so burdened by onerous taxes as to be driven to cut the forests and dispose of the timber in sheer self-defense. That this process is socially suicidal should be evident without argument. It continues, nevertheless. Friends of the forests should take a strong stand against taxation which works such havoc.—Forestry and Irrigation.

Timber owners and manufacturers will be interested in the results of the detailed studies of commercial timber trees which the Forest Service of the United States Department of Agriculture is making. These studies are not confined exclusively to the well-known trees of recognized value, but, owing to the rapid decrease in the supply of our valuable woods, include those cheaper woods whose properties are imperfectly known.

A wine maker in Cloverdale maintains that grape prices may reach \$30.

Pioneer

Rubber Sanded ROOFING

Always a permanent protection against rain and sun. Spark and cinder proof—does not curl, warp or crack.

Easiest to lay and when once laid is down to stay.

That wear-proof surface of hard flint sand—adds years and years of wear—eliminates the repair bill and requires no painting at any time.

Best for every roof.

Unfermented Grape Juice.

Please let me know what is the best method of putting up unfermented grape juice?—F. P. S., San Bernardino.

See Mr. Mill's article on page 244 of this issue.

Keep off Suckers.

In the Cultivator of Aug. 15th, page 149, you say "many of trees and shrubs throw out suckers in early summer, by cutting them off much of sap needed elsewhere by the trees will be saved." Does this advice about suckers apply to pear trees which have just been relieved of fruit?—S. S.

We surely would keep off all water sprouts or suckers from all trees. They are of no value and take sap which should go into wood and fruit buds. They should be kept off early in season to save the summer growth.

Cow Peas—Artichokes.

Are there any cow peas grown in California? Where may I get seed? Will artichokes do well in this part of the State?—J. H. W., Tulare.

Cow peas are not grown to any extent in California. They were tried for green manuring but as they would not grow thrifty through the cooler season they were discarded for the far more profitable vetch and Canadian pea. We think seed houses advertising in Cultivator can supply you with the seed.

If by artichokes you mean the tuber-Jerusalem artichokes, we do not question but they will do well with you. As to the Globe artichoke, of which the edible part are portions of the flower bud, will probably do well, for so far as we know it is not exacting as to climatic conditions.

Mildew.

I am sending you a bunch of Thompson's seedless grapes that are affected by something. Can you tell me what is the matter? Some vines have runners with healthy bunches. Second crop Tokay and other grapes are also affected.—C. M. S., Willows.

The grapes are affected with mildew and are past saving for this crop. Another year sulphur heavily under vines early in season.

Budding.

I would like to get some information concerning the working over of fairly large loquat trees. Would you bud or graft and what method and time? Also would like to know where I can get a good standard work on budding and grafting of citrus and walnuts?—C. S. K.

Loquats can be budded while growing and full of sap. Write Department of Agriculture at Washington for Nut Culture; also to John Isaac, State Horticultural Commissioner, office, Sacramento, Cal., for Citrus in California. Also Teague's nursery, San Dimas, for "Citrus Fruits."

Screen.

I am wishing to plant something between the house and barn for the purpose of shutting out the view. What tree or plant will make a nice fence? We want it to grow much higher than a fence would be and something that will be evergreen. Some one suggested pepper trees planted closely together and keep them trimmed. What do you suggest? We want something that will grow quickly and

not exhaust the soil.—Mrs. A. Nordhoff.

Giant bamboo is fine. A high trellis with Concord grapes, or, if in hurry, Australian pea vine or morning glory or other quick growing vines. The pepper suggestion is good but we would prefer the others, especially the bamboo for it makes a beautiful screen.

Mildew—Aphis.

I enclose leaves of rose bushes. have several varieties of choice climbers and the new growth is worse with this mildew, or whatever it is. Early in the season they were badly covered with a little green louse. I washed them well in soap suds. Have seen none of the lice for some time now, but the leaves continue to look like the enclosed.—A. T.

They are badly afflicted with mildew. Sulphur is a remedy, but as good as Bordeaux mixture. Apply early in season. Also keep off aphids as fast as they appear with strong suds.

Address.

Will you kindly give me the address of the A. I. Root Co., publishers of Gleanings in Bee Culture?—J. W. Kern City.

Medina, Ohio.

Chrysanthemums.

Please give me a few suggestions as to the proper care of chrysanthemums now. What shoots should be nipped off and do they need much water?—E. McG., Watsonville.

We will have an article in a short time on chrysanthemum culture. If you wish large flowers remove weak and small buds. If you want very large, fine flowers remove fast as formed except crown buds. Dig thoroughly, also fertilize to size.

Milk Goats.

Correspondents continually write "Where can I get information about milk goats." Any subscriber who knows them, or knows where such can be had, will confer a favor by writing.

Nut Buyer.

Will you kindly state through columns of the Cultivator a company buying almonds and other nuts in Los Angeles?—L. J., Selinas.

Percy R. Wilding Co., 307 Third Ave., Los Angeles.

Corn Husks.

Will you please inform me where I can dispose of corn husks? Please give me the address of some one who makes tamales.—E. E. Y., Corning.

Write Simon Levi Commission, Los Angeles.

Treatment of Wood.

I have been informed that there is a process by which the willow can be treated which renders it very serviceable for vineyard stakes—in fact as good as redwood. Is this a fact? If so, give me through the columns of your valuable periodical, the details of the treatment as I have 130 acres to stake this coming winter. Is there any difference in the durability of a willow stake cut during the winter than cut during the summer.—W. A. W., Woodbridge.

We do not think there is any simple process by which green stakes can be treated. The railroad plan of treating ties with creosote and creosol

compounds involves expensive plant. Any subscriber can send in suggestions to enquirer we will be glad to publish. In general, greater durability results from cutting when sap is out of the tree.

A HONEY-BEARING EUCALYPT.

James Brogan, of Attunga, Australia, in a plea for the preservation of "yellow-box" (*Eucalyptus melliodora*) from the ringbarker, draws attention to the especial value of this variety of number tree for honey production. From his experience, the honey harvested by bees from any given area of "yellow-box" is of greater monetary value than the wool that could be raised from the grass on the same area. There are seventy acres of this variety of tree on his own place, and in some seasons he has obtained more value in honey than if the area had been cropped with good wheat at a fair price.

As a useful timber "Yellow-box" stands in the ground twice as long as ordinary box, and should be very valuable for mining timbers, as nearly every tree about would make lengths suitable for mining requirements. This tree has been grown but sparingly in California, though it seems to do very well. As few planters have set out plantations for other than fuel purposes this great family of trees has never been fairly or sufficiently tested. —Condado Times.

THINKS THE INDEX OF VALUE.

The Cultivator has remarked before that it appreciates criticism and favorable comment. They both help to make a more valued paper. They show wherein we fail and should make a change or wherein we are doing all right and may do better. A year ago letter came from Santa Ana with criticism and request for an addition to the Cultivator to make it more valuable. Now comes the following appreciation:

Something like a year or more ago I asked if we couldn't have a table of contents in our much valued agricultural magazine, The California Cultivator. This year there has appeared a table of contents covering every article that has appeared in the Cultivator from January 1st to July 1st 1907, which has been a great comfort to me. So many, many times I've wanted to refer to something I had read and with that splendid table of contents I could find the desired article in a few minutes, which would, without the table of contents, have taken hours to find. I wish, for one, to thank the Cultivator for that most acceptably convenient addition to its pages. I hope his will be added every month. —L. A. MERIGOLD, Santa Ana.

A BIG "EGG."

The biggest egg ever laid on the Cultivator desk was gathered last week. It was no ostrich, either, though it measured 24 inches in circumference (26 inches, the largest egg) and weighed nearly four pounds. It was no pullet's egg. It was "laid" by a grower at Santa Paula, Mr. C. H. Thordon, and is one of the finest fruit egg plants we ever saw. It was indeed too fine a specimen to cut so it was taken to the Chamber of Commerce where it is now on exhibition.

BEST EVER.

Please discontinue sending the paper as I am leaving this country very early. I must congratulate you on your valuable paper. I consider it the best agricultural paper I ever had the pleasure of reading. —G. A. McCarthy, Los Angeles, Cal.

EMERGENCY COOLING.

It sometimes happens on warm afternoons that the supply of ice fails and the butter softens. Try this method of keeping it hard: Place a large earthenware bowl on the kitchen table, and in it place a small bowl upside down. On this inverted bowl put the butter dish containing sufficient butter for the next meal, wrapped in oil paper. Over this spread a clean napkin, covering the small bowl and the edges resting on the bottom of the bowl with fresh cold water up to the level of the butter plate. Put a heavy towel over the large bowl with the ends wrapped around it. Two hours later you may remove the towel and the napkin (the latter now completely saturated with water), and the butter will be firm and hard. The napkin acts as a wick, and brings the cold water up to the butter, chilling and hardening it. —Woman's Home Companion.

DAIRY NOTES.

Your well bred cow if kept in good condition will respond to feed in giving milk. It is well known that certain foods are milk producers.

On a pasture of green grass the flow will continue much longer than on hay, hence it becomes necessary as the pastures dry up to supply that which most nearly takes the place of green grass. Those fortunate enough to be located near a sugar factory can easily obtain a succulent food at comparatively slight cost.

A prominent dairyman who, if possible, feeds pulp the year around, makes the statement that "sugar beet pulp is the mainstay of the dairy business."

By proper feeding it is true that cows can be kept milking profitably during a longer period than otherwise.

The most profitable milch cow is the one that comes the nearest to milking the year around with only the proper intervals before again becoming fresh. —H. J.

"ENTOMOLOGY IN OUTLINE."

I want to especially recommend the practical treatise relating to insects, beneficial and injurious, published, under the authority of the Horticultural Commission, by John Isaac. The work was incorporated with the annual report of the commissioner, but is also published separately, in pamphlet form, and may be had by applying to the Secretary at Sacramento. Mr. Isaac has a most happy way of describing briefly the most important points on this most important subject. Every grower is fortunate who secures a copy. —Leonard Coates, Morganhill.

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

A GREAT MANY HELPFUL THINGS.

I wish to express my appreciation of your paper. As an amateur farmer I find a great many helpful things in it. —H. R. Hitchcock, Santa Barbara.

VALUABLE FRIEND.

The Cultivator is a valuable friend to the rancher. —J. C. Ellis, Fresno,

A Life Income from Land Investment

7 per cent. guaranteed, payable semi-annually. No risks. Sugar plantations pay 33 1-3 and more when in full cultivation. One planting good for dozen years.

We own 9489 acres of richest land in State of Vera Cruz, Mexico, near Tampico. Sell you one to a hundred acres and contract to cultivate for fifty years and pay you the profit.

Best Crop Profit in the World

No other crop in the world as rich or as certain. Our plan is simple and safe. Your money does the work for you.

We Do All the Work—You Stay at Home and Enjoy the Profit

It will pay you to know more of our sugar plantation profit-sharing plan. George Gould, speaking of this section, says: "The great Southwest will surprise the world in the next ten years with its development." Let us tell you more.

THE CHANGE.

Before she went to boardin' school she useter romp an' play, She druv the cows from the field an' helped take in the hay, But she don't do that any more, because of this, you see— She went away as Mary Jane an' came back Jeanne Marie.

She uester wear made-over clothes, an' always with a smile, But now her dresses every one must be the latest style. She don't ride bareback any more, nor climb the apple tree— She went away as Mary Jane, but come back Jeanne Marie.

Her hair is all in crinkles now—she calls 'em Marshal waves; She's up in all the etiquette, real stylish she behaves. Her ma and me are mighty proud o' all she's learned—but gee, We sometimes wish for Mary Jane instid o' Jeanne Marie! —Mrs. Elsie Duncan Yale in Woman's Home Companion.

BY THE SEA.

Written for the Cultivator by Julia Hughes Persing.

THE fisherman were hauling in the seine. It was a foggy morning, the mist falling like fine rain. The men worked steadily, silently. They pulled the tangled seaweed from the ropes and waded out with bare feet to draw the seine safely through the larger breakers. In the trail of the net still leaped and played the sportive sardines which had escaped from the meshes and now glistened like bits of silver on the breaking water.

Around the men stood a number of persons, watching with interest the swift sorting of the fish. Barefoot boys, with pails or baskets, darted quickly amid the group on the alert for all rejected fish.

Over the waves came a dark line of birds—the sea gulls, watching for their prey.

Down the steps of the large hotel on the bluff came, leisurely, a young woman with an older man at her side shielding her from the mist by his carefully held umbrella.

"Let us watch the fishermen," she said. As they neared the men, she stopped for an instant, her face pale, her eyes frightened. Her companion, unnoting, pointed out the baskets of the cherished pompho, for which the fishermen toiled so patiently.

At the left of the little group stood a young man with clear high forehead and clean cut face. Standing erect, with head thrown back, his face, too, grown pale—he stood looking straight at the approaching pair.

The young woman shivered as though from cold.

"Why, Enid!" said her companion, noting for the first her agitation. "Are you ill?" "Shall we go back to the hotel?"

"No," striving for self-control. "I shall be all right in a moment. But—well—" turning helplessly towards him. Seeing his grave face, she suddenly grew calmer and her voice quiet.

"Herbert, I cannot explain now. But I used to know that young man over there. May I speak with him a moment? I shall not detain you long."

"Certainly, Enid," he replied, courteously, "I shall await you at the turn," and raising his hat, though with a look of pain on his face and a keen penetrating glance at the younger man—he passed on ahead.

Nervously Enid Temple turned towards the eyes so steadily observing

her. Their owner came at once in response to her gesture, but waited for her to speak.

"A great wrong has been done you, Tom," she said at last. It was not what she meant to say.

"Of what use to bring up the past?" he asked quietly, as they moved out of the hearing of others.

"But they told me you were dead!"

"Who told you?"

"My father," hesitatingly, at first, then bitterly. "He has ruined our lives."

"Enid," said the young man, sternly, "Did you not send that last message?" He peered eagerly into the fair face before him.

"He told me you wished never to see me again, and that you wanted to marry that rich old lawyer."

"Poor papa!" sobbed the girl. "Oh, Tom! he is dead now. He must have meant well, but how different it all might have been!"

Tom looked straight towards the turn. "And that man awaiting you? Is he the old lawyer?"

"Yes."

"And—?"

"And my husband," she said slowly.

The silence hung heavy between them, frightened by memories of the past and for the future—fears.

All had been explained. There was nothing more to be said.

The sun broke through the fog, the mists seemed to lift and clear away as the sunshine kissed the rippling water and glanced back from shore to sea.

So broke, gradually, the clouds on the young man's brow. Somehow the sight of the tall man waiting at the turn beyond them, the man with many silver glints in his hair, stirred through his being like a refiner's touch.

How easily he could wreck that man's happiness and bring discord into his life! It was a noble, useful life of which he had heard much. Should he so use his power over this fair woman at his side?

Self receded within him, ashamed of the bare thought. And a chivalry, born of his best and highest nature, pulsed through his being and shone now from his clear eyes.

"Well," he said, easily, and smiling as he spoke, "the fates played against us, Enid, but we can still be friends and believe it was all for the best. You have a husband of whom you ought to be proud. I have heard him spoken of in the highest terms. He is the soul of honor. And as for myself—well, over beyond the bay there lives the dearest of girls. Can you not congratulate me in advance?"

"Are you really to be married?" asked Enid Temple, her grieved, hurt look blending into great surprise.

"You see we can smile at these tricks of fate. Our troubles are much like those of our childhood, terrible at the time, but easily forgotten. Now will you take me to your husband? I should feel honored to meet him."

Almost bewildered Enid Temple led the way to her husband, looking at him as in a new light.

She noted as for the first how firm were his eyes when the pained look vanished from their dark depths and his face and manner responded to Tom's cordial, straight-forward greeting. The two men talked easily, while Enid listened, making involuntary comparisons in her heart, which surprised herself. When, after a little, Tom left them and they wended their

way towards the hotel. Lawyer Temple asked no questions. His deep forebodings had fled. He drew his wife's hand within his arm and they walked silently. And when at steps he paused a moment and looked earnestly into the face he loved—was raised to his, clear and shining. And he was content.

BAKED CANNED PEARS.

Not many housewives know how delicious are baked canned pears, now during pear season a hint concerning them is not out of place.

Fill a bake pan full, (a two-quart glass jar holds eleven medium sized ones), sprinkle with half a cup sugar and fill in water until the pears are more than half covered. Boil until tender then set on top of stove a moment to let the syrup come to a brisk boil and put into jars. The pears are too large to slip easily cut in half, after baking.

After canning one jar the correct amount of syrup can be estimated well as the number of pears to a jar. If the syrup runs a little short at first quickly boil the new amount, keeping the jar covered the meantime.

Besides the change from the old way and the delicious flavor of the new the baking is a time and fuel saving for one can be baking them in the oven as well as boiling others on the stove in the regular way; when it comes time to eat them, a satisfied housewife will almost wonder that she had canned them all the while. —Elizabeth Clark, Poway.

ICE BOX.

Across one end of a small washroom off from the kitchen, I had an ice box built of matched lumber, a width of the room, eight feet, extending into the room four feet high, six feet. Inside of this is another box four inches smaller every way and built the same except space for two doors in front, and door top to put in ice. All spaces filled with sawdust. Across the box, six feet from top, slats are laid, upon which to place ice. A piece of the length of box, curved to catch the water from melted ice, is supported by wires just under slats. The slopes a little and water runs into a five-gallon jar under the lower door. The jar never runs over as we fill the water (which of course is saved for washing hands. A small pipe runs through to open air and a small piece of netting is tied over the end to exclude flies. I would not without my ice box for many years its cost, which is very little. I have all the milk, cream and butter I need and could put shelves in to hold more if necessary. It is so much easier to step out of the kitchen, to another room to get milk, than to go down cellar, and I have saved many miles of walking in the course of the summer.

In the question of expense in necessary food, meat stands high. Nearly all vegetable foods furnish more vital energy than meat for flour, corn meal are very much cheaper, and just as valuable. But, on the other hand, there are many people who do not thrive on such food and demand meat. Then, beside the cost of meat being so great, the amount of time spent in cooking many dishes involves much expense in fuel—roasting and boiling require hours. Another point is that in beef and fat in beef, mutton, etc., the head, feet and entrails in fowls, the consumer pays for much that is not eaten; also that the shrinkage, particularly in stewing and boiling, is considerable.

The Personal Neatness Club

INTEREST is increasing in our club. Let others increase it still more by sending in little hints, or big questions, for this is the department which depends entirely on the interest of the readers. One man, a horrid man, wrote last week that he had read the Personal Neatness Club department and liked it, and as it had invited queries "would we please tell him where he could buy automobiles." This so surprised me that I haven't gotten over it yet, for if there is anything which doesn't add to neatness, it's the chug wagon. The last ride I took I had eyes, ears, mouth and hair so filled with dust I haven't felt perfectly normal since.

But here is another man, an interloper, who breaks in with a suggestion to girls which almost borders on impertinence. But as he "Uncles" us we'll let him in if he won't come any more.

Look at what the horrid thing says:

Keep your Elbows Clean.

If that "Neatness Club" of yours amounts to anything, it had better take up a collection to buy soap for these girls with dirty elbows which are always protruding these days, and showing what I have maintained was common, every day dirt. My niece is shocked that I should dub "tan"—tan is stylish, you know,—with a name so plebian and common as "dirt."

I never admired this custom of 'peek-a-boo' elbows, but girls, if you must do it, for goodness sake keep your elbows clean. Not only wash clean but don't put down on dirty counters and other places. If you do, wear a corn plaster or something of that kind on your elbows.—Uncle Josh.

Well, that's pretty raw, but here's something more to our taste. From a girl friend with genuine, friendly hints.

Be Dainty and Neat.

The dainty girl has learned that it not only adds to her self respect and pleases her friends for her to dress tastefully and becomingly, but that it actually pays from a financial point of view. Clothes that are well cared for will last twice as long as those that are carelessly treated. Neglected clothing is always unattractive and even repulsive. Hats and dress cannot long be thrown around carelessly without giving strong evidence of such lack of care, and there is always a charm about the neatly dressed girl, no matter how cheap the material from which her clothes are made or how plain the styles adopted.

Everything depends upon how a woman dresses her neck, whether she looks well or not, and if a girl will study out the charming possibilities of odd pieces of lace and linen, she can have lovely neckwear without any expenditure of money, and the economical girl not only makes her own pretty stocks and ties but she learns how to launder them as well. Such articles can be washed as they will lose none of their beauty if they are put to soak over night in a warm earline suds, as the longer they remain in the suds the less rubbing they will require, and anything that needs rubbing is a saving to the fabric, and fine handkerchiefs can be kept clean with very little rubbing or washing in the same way.

The woman who always dresses neatly at home is more likely to re-

tain the respect of her family and friends than one who is careless and neglectful. To be neatly and becomingly dressed is far more a matter of care than money, for a girl often appears as well dressed as her neighbor who spends twice the amount of money on her output in clothing, because one cares for her clothes while the other neglects them. It is said that neatness is one of the most attractive of feminine qualities to a man, but that it is also one of the rarest.—A. M. H.

That's a good letter. I hope it will inspire some of our girl friends with a determination to be neater in her dress. A stitch in time or a little gasoline or cholorform to remove spots is so easy, yet mean so much.

At first I wished A. M. H. had left off that last word. Is it a fact that neatness is one of the rarest of feminine attractions? At first I said no, but I don't know but the statement is about correct. Time without number I have seen girls approaching who were attired in a stunning costume, big picture hat, ostrich feather and all, yet on closer approach the shoddy becomes apparent. Hair carelessly combed, ribbons flashy, but soiled, and other revelations of character are thus shown to the world.

Personal beauty, that is, fair complexion, regular features, perfect form, all may not command; but that greater attraction of being becomingly attired, no matter how simple, together with a pure mind may be possessed by all. Such possession gives attractiveness and power.

Toilet Soap.

Save all the small bits of toilet soap and when you have collected a nice quantity of the pieces, cover them with boiling water, then add a tablespoonful of borax and place on the back of the stove where the pieces will melt slowly. When all are dissolved, stir in enough ground oatmeal to make a stiff batter, then pour in a greased dish, and when it is cold cut into squares, and you will find no finer toilet soap than this, as the borax softens the water, and the oatmeal whitens the skin and is especially good for tan and surburns.

The best way to clean a hair brush is to use warm soapsuds with a little borax added, then rinse the bristles with tepid water and place with the bristles downward to dry.

Brass candlesticks or other articles of brass can be kept bright by rubbing with a paste made of rottenstone and turpentine.

Painted china trays can be kept clean by pouring warm water over them and then drying with a soft cloth; but the rubbing should be gentle as hard rubbing and soapsuds will soon ruin these pretty dishes and trays.

HELPFUL HINTS.

Do you know that a few drops of essence of sassafras will keep flies away?

That unused silver will keep bright if laid away in a box of flour?

That cloves or salt sprinkled on a pantry shelf will rid it of ants?

That you can make a faded dress perfectly white by washing it in boiling water?

That salt dissolved in alcohol will often remove grease spots from clothing?

That linen blinds can be cleaned by being laid flat and rubbed with powdered bath brick?

Largest National Bank West of Denver and South of San Francisco

First National Bank

United States Depository for Government Funds

TOTAL RESOURCES, \$20,000,000

ADDITIONAL ASSETS—One Million Five Hundred Thousand Dollars invested in the stock of the Los Angeles Trust Company and the Metropolitan Bank and Trust Co., and held by the officers of the First National Bank, as Trustees, in the interest of the shareholders of that Bank.

BOOKS.

FREE—"THE POULTRY MANUAL," BY those high authorities, F. L. Sewell and Ida E. Tilson, profusely illustrated. Send us the names of twelve persons keeping any poultry, and we will send it to you absolutely free and postage prepaid. WEST COAST STOCK FOOD CO., 818 San Fernando St., Los Angeles, Cal.

A NORWAY TOWN WITHOUT TAXES.

"The town of Faleide, Norway, imposes no taxes on its lucky inhabitants," says the London, Eng., By-stander. During the last thirty years the authorities at Faleide have sold over \$5,000,000 worth of trees, and, by judicious replanting, have provided for a similar income every thirty years. In consequence of this source of commercial wealth, there are no taxes in Faleide, and local railways and telephones are free, as well as education and drinks—upon the King's birthday!"

How Utopian the suggestion, at first blush, of a "town without taxes!" Yet the explanation is simple. Instead of permitting all its forest lands to become private property, to be cut over, burned over and converted into a desert, this town has simply retained an area for its own use, and has administered the forests thereon in accordance with forestry principles. In consequence, the community enjoys a permanent income from a permanent estate; an income, furthermore, sufficiently large to render taxation unnecessary.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Sept. 10, 1907.

Butter.

Butter remains firm at the prices quoted last week.

Oil cake meal.....2.50
Rolled Barley.....1.40
Rolled barley per ton.....25.00
Feed meal.....1.70
Kaffir Corn.....1.65

Farmers in Utah are renewing their grain land by growing alfalfa on them for three or four years and then plowing the ground and seeding to grain, which yields well for three or four years more. Land owners in the Sacramento valley can learn something from Utah if the evidence afforded by their own state does not prove convincing. Adding to the alfalfa dairy cows enough to eat it up, thus restoring the hay as well as the roots to the soil accelerates the process. This formula is as invariable as the multiplication table.—Sacramento Union.

Woodin & Little, one of the oldest and most reliable firms on the Pacific Coast, advertise their extensive San Francisco house in this issue. If any of our readers wish anything in the line of pumps, wind mills, gasoline engines, tanks, pipes or fittings, or anything along these lines, drop a letter or postal card to Woodin & Little, 534-536 Mission Street, San Francisco, and ask them to send you Catalogue A. This notice especially applies to all our readers in Northern and Central California, where freight rates permit especially low prices on all shipments from San Francisco.

Hay.

The weekly trade circular of Scott & Magner, descriptive of the hay market, is as follows:

We have nothing particularly new to remark in relation to the existing situation in hay. Conditions remain just about the same as outlined in our last report. The main change to note is in the fact that the little shower that we had this week has developed a strong uneasiness on the part of all who are interested in hay. It may be that we will have a long spell of good weather before the first rains begin, but as there is no assurance of this, we are all uneasy about the hay that is out and unprotected. This feeling has caused an extra effort to be made all along the line, to endeavor to move the hay both into the warehouse and to boat and car for transportation. It has also caused the farmers to concede somewhat their asking prices where transportation is offered. The railroad companies have been furnishing a few more cars, but not enough to make much impression on the immense quantities of hay clamoring for transportation all along the railroad lines.

Grain.

Regarding the grain situation the Chronicle says:

Operations in the local grain market were rather limited yesterday, but prices were strongly held and in some instances advanced. The upward tendency in the price on wheat has been steady for some little time and dealers are now looking for an increase on our. The flour from the north is slightly higher and the local product will doubtless be advanced within a few days. The advices from Chicago yesterday showed an undertone bullish in character.

Citrus Market

LOS ANGELES, Sept. 9, 1907.

There has been a good demand for all first class grades of fruit. Lower grades easier and some lower. Generally the market has been steady. Weather has been cool and in most Eastern markets cloudy conditions have prevailed as a rule. Total shipments to Sunday reported as follows: Carloads, 23,809, of which 3204 were lemons. Last season to date there were shipped 25,326 carloads, of which 591 were lemons.

NEW YORK, Sept. 9th, 1907.

The market has been good for all uncry fruits. Prices as follows:

GOVERNMENT WORK FOR AGRICULTURE.

The government has been doing a great work for agriculture. In report of the Reclamation Service to January 1st it is stated that up to the time specified the government has dug 1267 miles of canals or nearly the distance from Washington to Omaha. Some of these canals carry whole rivers, like the Truckee river in Nevada and the North Platte in Wyoming. The tunnels excavated are 47 in number, and have an aggregate length of nine and one-half miles. The service has erected 94 large structures, including the great dams in Nevada and the Minidoka dam in Idaho 80 feet high and 650 feet long. It has completed 670 head-works, flumes, etc. It has built 376 miles of wagon road in mountainous country and into heretofore inaccessible regions. It has erected and in operation 727 miles of telephones. Its own cement mill has manufactured 70,000 barrels of cement and the purchased amount is 312,000 barrels. Its own saw mills have cut 3,036,000 feet B. M. of lumber and 6,540,000 feet have been purchased. The surveying parties of the service have completed topographic surveys covering 10,970 square miles, an area greater than the combined areas of Massachusetts and Rhode Island. The transit lines had a length of 18,900 linear miles, while the level lines run amount to 24,218 miles, or nearly sufficient to go around the earth.

The diamond drillings for dam sites and canals amount to 47,515 feet or more than 9 miles. Today the service owns and has at work 1154 horses and mules. It operates 9 locomotives, 223 cars and 23 miles or railroad, 39 stationary engines and steam engines. It has constructed and is operating 5 electric light plants. This work has been carried on with the following force: Classified Service, 380, including Washington office. Laborers directly employed by the government, 3500; laborers employed by contractors, 6100 or a total of all forces of 10,000. The expenditures

now total nearly \$1,000,000 per month. As a result of the operations of the Reclamation Service eight new towns have been established, 100 miles of branch railroads have been constructed, and 10,000 people have taken up their residence in the desert.

A FALSE SYSTEM OF EDUCATION.

"My department in the Woman's Home Companion, 'For the Girl Who Earns Her Own Living,' says Anna Steese Richardson in her September contribution, "brings to my desk from would-be wage earners hundreds of letters every month. Less than five per cent bear the postoffice stamp of large cities. About fifty per cent come from small cities, towns and hamlets, and contain inquiries about business colleges, training schools for various trades, and avenues of wage earning in larger cities. The remaining forty-five per cent come from farms and their burden is: 'I cannot stand the monotony of farm life, and in this small community there is absolutely no way in which I can earn enough money to escape.'

"Escape!" That is the war cry of the inexperienced, restless, intractable girl of today. She has vague ideas of what she is trying to escape, but generally speaking it is what she terms the monotony of a domestic existence, which is in reality her apprenticeship in the art of home making.

"This article is not intended as a reproach upon the girl herself, but rather upon the false system of education, the abnormal economic conditions which force her into such a position and such beliefs.

"Study the average household in cities, large and small, in county seats or in towns which can boast of unimportant industries giving employment to women. To what end is the girl given an education? Almost invariably to fill some position in the commercial or professional world. Statistics prove that comparatively few girls go beyond the grammar grades. At sixteen they graduate into a business college, shop, factory or office."

SOUR CLOVER IN ALFALFA.

Many queries are made this year as to "Sour Clover" which is somewhat of a pest in many alfalfa fields. Regarding this pest and its eradication, Prof. Wickson says:

"Melilotus alba has some favor in the Eastern States as a forage plant. It is also a good honey plant for bees, but stock will not eat it if they can find anything better, and in the alfalfa fields it is a great pest. It is, however, a biennial and not a perennial like alfalfa, and if one is careful not to allow it to go to seed it will disappear. In pastured alfalfa this means that all the Melilotus plants must be either cut below the root crown or pulled out when the ground is soft enough by irrigation to make it possible to pull out its long taproot.

"I do not know of any way to prevent selling foul seeds except the method which is now being applied by the United States Department of Agriculture, and that is to examine dealers' stock and to expose all dealers found to be carrying unclean seed."

. Washtucna, Washington, grain growers report that one-half of standing fields have been ruined by the storms.

GEOLOGIC WORK IN NATIONAL FORESTS.

The United States Geological Survey, in connection with its other work in the West, has undertaken to examine geologic conditions in the National forests. It has been the policy of the Government to encourage mining in the areas included in the National forests, but many fraudulent entries have been found, which cover non-mineral lands or deposits that by no possibility could be developed into paying mines, and it is clearly in the interest of legitimate mining enterprises to prevent "wildcat" mining companies from obtaining titles to the lands covered by such-claims.

The work of the Survey will be of practical value both to the Forest Service and to the miners, for the reports of the geologists will enable to Forester to make recommendations to the Commissioner of the General Land Office on the character of mineral locations. The policy of the Survey will be to require its geologists to assist in every way the claimant who is acting in good faith and to help the officers of the Forest Service in their task of protecting the mining industry and all other interests which benefit by the proper administration of the National forests.

TO DESTROY CACTUS.

Many farmers are clearing up cactus land in California and they are employing the old methods, cutting it off carrying it away and piling it.

A few dollars worth of white arsenic dissolved in boiling sal soda solution and made up to 20 gallons of water to one pound of arsenic and used as a spray will kill the cactus over a large area so that it will dry sufficiently to burn as readily as dry grass by fall. This has been practiced in many places and is a cheap and easy method of destroying this troublesome plant.

SIZED UP HIS FATHER.

While the mother and faithful old Ellen were away Jimmie and his father looked after themselves—Jimmie rather less than his father, says the Youth's Companion. As it was vacation, Jimmie got up when he chose, ate what he liked, amused himself in his own way and went to bed when he was sleepy, sometimes in his own bed, and his father never said a word.

Every morning when his father went to town he kissed Jimmie and said: "Be a good boy."

This wholly reasonable command was never accompanied by any don'ts. "Don't fight, don't tear your clothes, don't tease the cat"—it was too early to go in swimming—or "don't play on the railroad track." And Jimmie's joyful "Yes, daddy!" was invariably followed by a series of handsprings down the walk to the gate and back again by way of working off the overflow.

When his father came home at night he never asked Jimmie if he had been a good boy. He found a cleanish place to kiss, and ignored completely the rent in the corduroys or the bruise under the eye. Once, when the night was wet and both were feeling a little lonely, Jimmie, sitting close, showed his appreciation and understanding of such delicacy.

"I say, daddy," he whispered, "you make it awful easy to be good, I guess you were a pretty bad one, weren't you?"

The Raisin Festival at Fresno

Drying Raisins in the Vineyard.

Courtesy State Board of Trade

A STRIKING object met me the other morning as I stepped from the Southern Pacific train at Fresno. The gateway to town at Mariposa street near the depot was a magnificent archway of fruits. The base was of watermelons, loads of them, then above and spanning the street grapes in magnificent bunches. White grapes, blue grapes, red grapes and all great fine bunches. Some fastened to the top of archway, others pendant under it. More fronts had the same prodigal display of fruits and, of course, everywhere was bunting for a filler.

The inspiring cause of the festival was the making up of the National Irrigation Congress. To strangers brought to our gates by that great event were here with open eyes and, while a raisin or other festival may not be proof of the greatness of any section, it may be the drawing card which will attract the people to investigate its merits. I believe such was the case at Fresno. It was not my privilege to remain through the festival, in fact, saw only its beginning, but many wondering people, never before in a raisin section, were all attention and gathering information of the land which under a San Joaquin valley sun and the waters of the Sierra Nevada mountains bring forth wonderful grapes. The

finest raisins in the world. And in quantity forty thousand tons. "Yes, and then some," says an enthusiastic resident. Lest it be imagined that Fresno's greatness all, from foundation to top is constructed of raisins, let me quote:

"When we speak of alfalfa the subject of dairying also crops up, because Fresno county is rapidly becoming a great dairying center. The profits are substantial and unlike many other branches of farming it has a regular steady monthly income from the sale of butter fat, which is a great boon to the man of limited means.

"Thousands of head of poor cattle are shipped into Fresno county from Arizona, New Mexico and Southern districts to be fattened, and after two months' browsing on our splendid pastures increase in value from \$20 to \$30 per head."

About 350,000 acres are annually planted in this county to wheat and barley. Then there's honey and watermelons and lumber, garden stuff, all kinds of deciduous fruits. Yes, and citrus fruits. Now I touch a subject which makes the foothillers along the eastern edge swell up and get chesty. I have never been along the foothills in this country, but when oranges are mentioned in the presence of a believer in Fresno, he has that far-away look which says that he has knowledge which would astonish the world if it should all

be made known. But seriously, there are fine oranges grown in Fresno.

But about the festival? I had forgotten. The autos, a caravan of them, waited at the front of the beautiful little Chamber of Commerce building at 10 o'clock on Admission Day. They were soon filled and took the party to the great property bequeathed by the late M. T. Kearney to the State University—Kearney Park. Returning at noon all visitors were taken to Margherita vineyard where luncheon was served. Car rides to Clovis with evening reception at Chamber of Commerce building; music, and always and everywhere plenty of fruit, finished the day. The next day trips to the vineyards at Selma, Fowler, Kingsburg and other places made up another round. On Wednesday Reedley and Fresno vineyards furnished the grapes to keep all from hunger and the day and the festival closed with a reception and entertainment at Recreation Park.

Thus ended the three days. The Republican in its welcome to the city said:

"For the visitors themselves, and for ten times as many, if they could have come, there will be entertainment and instruction to spare. Here they will see irrigation that is irrigation, on the largest and probably the most finished scale

Concluded on Page 273

Coulson's Improved Mash Egg Food

**Takes
Less
Feed**

**Makes
More
Eggs**

IF YOU WANT PLENTY OF EGGS THIS FALL AND WINTER when prices are high, you must lay your plans now. The hens must be given a strong feed which will enable them to get through the molt without loss of condition, and they will then quickly commence laying again.

First, see that your hens are healthy when they start to molt. At this time of the year, after a heavy laying season, they are apt not to be at their best, and a little of *Coulson's No. 3 Condition Powder* will put new life into them, and enable them to thoroughly digest and use the good food which they specially need.

At the same time, they must have the best food you can give them from the commencement of the molt. You will find *Coulson's Improved Mash Egg Food* is just what is required. It is strong in protein, due to the blood, meat, bone and oil cake meals which it contains.

Put Up in 90-lb. Sacks Directions in Each Sack

Your hens will not need to eat so much of the concentrated food to obtain the egg-making and feather-producing materials they need, thus saving their digestive organs and your pocket at the same time.

Coulson's Improved Mash Egg Food is therefore beneficial in two ways. Less feed is required and the hen gets just what she needs, with the result of a quicker molt and more eggs.

First cost is not everything, but even in this respect, COULSON'S IMPROVED MASH EGG FOOD shows to advantage. A 90-lb. sack will make a meal for 1250 hens. This is just over 2 lbs. a hen a month. Think how many eggs does it take to pay for this feed? In November, only 1 egg, and not more than 2 on the average.

We know what this feed will do by results on our own poultry ranch, as well as from testimonials from pleased customers all over California. What it does for others, it will do for you.

Give a trial order to your dealer; if he does not keep it, write to us, and we will either advise you where you can get it locally, or supply you direct.

Not All Manure Spreaders Pay

The idea of spreading manure properly is such a good one and the benefits derived are so great you are apt to think any spreader will give you these benefits—that a spreader is a spreader.

There is where you may make a mistake, for some spreaders are only trouble makers and the second season they are not taken out of the shed. To make them work takes too much time and costs too much money.

If you get that kind of spreader you're apt to conclude that spreaders are made to sell and not to spread manure.

SUCCESS SPREADERS

have 28 years' experience back of them—

KEMP & BURPEE MFG. CO., SYRACUSE, N. Y.

The California State Fair

A Good Fair---A Good Attendance---And Amongst the Attendants
an Occasional Farmer. A Few Observations by the Associate Editor

THE last fair ever to be held in the old pavilion at Sacramento, closed its doors last Saturday night. This old pavilion for many years has been the gathering place at special occasions for the society of Sacramento, and all over California. At the State Fair four years ago the central part of the structure was covered with tan bark and the social event of the fair was pulled off each evening when horses, draft, trotting and coach and even big Here-

The principal exhibits in the pavilion, and given the central and most conspicuous place, were the county exhibits. That is, counties competing for making the finest display of products. This to a certain extent was agricultural, but apparently the real motive behind it was the advertising of real estate or the advantages of any community, more than an honest competition of agricultural products. In fact, the large cash premiums offered for these displays were not on

string of animals. As he remarked, the winners could have been removed and still leave a magnificent display of Shorthorns. Jerseys made a creditable display though not by any means so large a class as the Shorthorns. Amongst these there were animals that were almost perfect from a show standpoint, and also for records for annual production which puts them in the "four hundred class of Jerseydom." The Holstein class was somewhat disappointing, not so much

A Prize Winning Berk

A Proud Prize Winner

A Little Hungarian Pony

Senior Champion Shorthorn Bull

and Shorthorns were led in under the influence of the swell set. That was when the grounds were in the outskirts of the city. The race track and grounds are removed four miles out, and the State Legislature made certain appropriations for buildings on the new grounds providing this old shell of a pavilion be removed from the park grounds which surround the State capitol. The time at which the old structure must be removed is next January, so that before another fair time, it will be razed to the ground, and the appropriation for the new building at the other grounds

the basis for a fine product of the soil, but a reward for the "finest display." In this competition there were twenty-one counties and they were most creditable. In fact, they were elegant.

Several implement houses, especially those handling gas engines and pumping plants, were largely represented and made a fine display.

At the race track—bear in mind we say the race track, for from the sign on the street car to every policeman on the corner, the word "race track" only is applied to the fair grounds, the word fair grounds apparently not conveying the

in quality of stock exhibited, as in the number, for Sacramento being in such close touch with so that a magnificent display of that class would be made. Some fine stock were, however, on exhibition. White faces were scarce, Dutch belted, of which there is said to be but one herd in the State, made quite a fine exhibit.

The swine class was very fine, especially as to Berks and Poland Chinas. Durocs came in with a showing of good animals, though a very small number. In the sheep and goat class there was not a great number of animals shown; however, it was to the credit of those who made the show-

A Corner in Machinery Hall

An Aristocratic Saddle Horse

have become available and a new and more fitting structure erected. It has always been an obstacle to securing best results at the fair, this separating of the stock from all other exhibits at the fair. The separation has made necessary the payment of two entrance fees in order to see the entire fair.

The fair this year was a fitting closing for the old pavilion, for it must be confessed it has been the best fair held in Sacramento for many years. Secretary Filcher apparently did some heavy work in gathering together such a representative display of exhibits, and while, as we say, it was the best held in many years in Sacramento, there is much to be desired to make it what it should be—an agricultural fair.

right meaning to the people of Sacramento. This is probably a holdover from the race track days when pool selling and horse racing under the shadiest of management was almost the only feature of the fair—at the race track, we repeat, there was some good racing, both of trotters, runners and "side wheelers," all apparently on fair and square basis with no gambling visible on the side. In fact, the tone prevailing about the track was entirely different than that which prevailed several years ago.

The stock exhibit was magnificent, especially was this the case in the Shorthorn class. In this, Prof. Carlyle, who was judge of the stock, was unstinted in his praise for the quality, not only of the premium winners, but almost the entire

ing, for animals of fine breeding that were exhibited.

The showing of draft horses was certainly to the credit of any fair, though in this respect Prof. Carlyle drew down upon himself about the only adverse criticism heard on the fair grounds. It was caused by his remark that California, as a rule, secured only culls or more inferior animals after the East had made its purchases. The remark was made apparently with the best intention to induce California buyers to be more exacting in their demands when buying. He said afterwards, however, that there was plenty of stock on the grounds which were far from culls.

German coachers, roadsters, saddle horses and even Shetland ponies were in evidence and made fine exhibits

Commercial tree studies begin with the tree in the forest and follow it the way to the finished product in the market.

Irrigation and Forestry

THE FLOW OF WATER IN PIPES.

A QUESTION often asked of the irrigation department of the Colorado Agricultural College by the farmers of the State is: how much water will a certain sized pipe carry under a certain head, say 10 feet, and what number of pipe would I recommend to stand the pressure say 25 pounds per square inch? A short discussion of this may be of interest to many farmers, so let me say that the quantity of water which a given pipe will carry depends upon many things; it depends upon the length of the pipe, the number and nature of bends in the pipe, the number and kind of valves in the pipe, etc. It is a very difficult thing, if not impossible thing, to derive a formula which will give results for every case, for the conditions affecting the flow are so many and so varied. However, we can approximate and come close enough for all practical purposes.

Rule.
The simplest rule I know of is this: a pipe 1 foot in diameter laid on a grade of 1 to 1000, will flow approximately 1 cubic foot per second. The quantity flowing varies as the 5-2 power of the diameter; the quantity also varies as the square root of the grade or slope. For an example: How much water will a pipe carry, which is 15 inches in diameter, on a grade of 3 feet to 1000? Fifteen inches is equal to 15-12 or 5-4 of a foot. If a pipe 1 foot in diameter on a grade of 1 foot in 1000 flows 1 cubic foot per second, and the quantity varies as the 5-2 power of the diameter; therefore the quantity from a 5-4 inch pipe on a grade of 1 foot in 1000 would be equal to 5-4 raised to the 5-2 power. The 5-2 power of a quantity means to take that quantity and raise it to the fifth power, then extract the square root. Hence taking 5-4 and multiplying it by itself 5 times (raising it to the fifth power,) will give us a fraction whose numerator is 3125 and the denominator is 1024. Extracting the square root of this fraction we get approximately 1.75 second feet. Now, remember the quantity varies also as the square root of the slope. In this problem the slope is not 1 in 1000, but 3 in 1000; therefore the quantity will equal the square root of 3, multiplied by this 1.75, which we obtained above, and the result will be 3.06 second feet, which is close enough to answer any ordinary purpose.

Another.
The more exact way of getting at practically the same problem, is this: Take 2-100 multiply it by the length of the pipe, divide this by the diameter in feet, or part of a foot, then add 1. Divide the head under which the water flows, expressed in feet, by the result; extract the square root of the quotient. Now take the result and multiply it by the square of the diameter, expressed in feet, or parts of a foot, and then multiply the result by 6.3 and you will have the quantity flowing in cubic feet per second. Remember the dimensions of the pipe must be all in feet, not inches.

For example: Suppose we have a pipe 6 inches in diameter, 100 feet long, under a head of 22 feet; find the quantity of water flowing. Following the above rule, we would have 100 feet multiplied by .02 equals 2 feet.

Now, 6 inches equals .5 of a foot and 2 divided by .5 equals 4. Adding 1.5 gives 5.5. The head, 22 feet, divided by 5.5 gives 4 for the result. Extracting the square root of this gives 2. Now take the diameter, .5 of a foot and square it; this gives .25. Multiply the above result by this .25 and we have .625. Then multiply this result .625 by 6.3, and we have the result 3.94, which is the quantity flowing in cubic feet per second.

Pressure Resistance.

Another question often propounded is this: What is the proper thickness of a pipe to stand the pressure of a certain head, say 50 feet? To get the pressure due to a certain head is always an easy matter. Take the head and multiply it by .434 and we have the pressure in pounds per square inch. One can easily remember this fraction by remembering that 1 cubic foot of water weighs 62½ pounds. There are 144 square inches in 1 square foot, so there would be 144 columns of water 1 foot high and 1 square inch in cross section. The weight of one of these columns can be found by dividing 62½ pounds by 144, which equals .434 pounds; hence the weight of a column of water 1 square inch in section and 50 feet high, will be 50 times .434 which equals 21.7 pounds, which, of course, is the pressure per square inch in the pipe.

In order to get the thickness of the pipe necessary to withstand a certain pressure, follow this rule: Take the pressure in pounds per square inch, calculated from the head if necessary, multiply it by the diameter of the pipe in inches and divide this result by twice the strength of the material of which the pipe is made. Better use for this strength about 3500 for steel, 2500 for wrought iron and 2000 for cast iron. This will give a good factor of safety. As an example: How thick should a steel pipe 18

inches in diameter be to withstand a head of 100 feet?

A 100-foot head will cause a pressure of 100 times .434 or 43.4 pounds.

The diameter 18 inches, Therefore 43.4 times 18 equals 881.2

Then divide by twice the strength: (2 times 3500 equals 7000,) and we have 881.2, divided by 7000 equals .126 inches, the thickness.—E. B. House.

Syria, once maintaining a multitude of prosperous towns and cities—Antioch having a population of half a million—is at present the scene of irreparable ruin. The destruction of Syria's forests, begun 2650 B. C., followed by

the disappearance of her soil and the decay of her industries, would alone have produced this effect. Babylon, once capital of the world, is a heap. Nineveh and Carthage, once the seats of mighty civilization, and abundantly equipped by generous Nature for permanent life, are desolate wastes. Man destroyed the forest, and lands which once flowed with milk and honey were transformed into deserts.

Nearly every farm has at least a few acres which are of little value for growing agricultural crops. This land should be set aside for a woodlot and devoted to the production of fuel, fence posts and timber for farm uses.

Popcorn Culture at Corcoran

Popcorn Seven Weeks Old at Corcoran, Kings County, Cal.

The value of popcorn as a commercial crop has been demonstrated in the region around Corcoran, where as high as 80 bushels to the acre has been raised. One man realized \$120 from an acre and a fraction of popcorn. In connection with poultry a few acres of popcorn is a paying proposition in the Corcoran district.

MILK CANS ROB YOU

Look through a microscope at milk set to cream in pans or cans and you'll see how they rob you. You'll see the caseine—the cheese part—forming a spidery web all through the milk. You'll see this web growing thicker and thicker until it forms solid curd. How can you expect all the cream to rise through that? It can't. This

caseine web catches a third to half the cream. You stand that loss just as long as you use pans or cans for they haven't enough skimming force to take out all the cream. But, just the minute you commence using a Sharples Dairy Tubular Cream Separator, you stop that loss.

Sharples Dairy Tubular Cream Separators have 10,000 times more skimming force than pans or cans, and twice as much as any other separator. They get all the cream—get it quick—get it free from dirt and in the best condition for making Gilt Edge Butter. Caseine don't bother the Tubular. The Tubular is positively certain to greatly increase your dairy profits, so write at once for catalog I-260 and our valuable free book, "Business Dairying."

SWINE.

WHILE selecting healthy, well-balanced parents has to do with vigorous offspring, the matter of feeding comes in to carry the well born ones to successful maturity. The abundant feeds of California and the mild climate bring the swine under more healthful conditions than in the East. Foul pig pens need not exist in California, if they do it is the owner's preference, not the pig's necessity.

The sow for breeding purposes should be one that has grown thriftily from birth. She should not be over fat at farrowing time if large litters of pigs are to be raised. If the youngsters do not get a proper start on their mother's milk it is hardly possible to bring them into fine hogs. Now when it is said that breeding stock of any kind should not be thin or yet over fat, it may be well to explain what is meant. The leanness must not be barrel stave condition, or as Pat says, sometimes, when we see some thin horses on the road, "Sure, if it was money he had in his pocket, it wouldn't be beer he'd be abusing." So the thin sow that looks as though she would buy barley, is too thin for a good milker and will fail to be successful as a pig producer. The over fat sow is one that is in show yard condition, and is also as much out of the way as the thin one. Of either of the errors extreme thinness, or over fatness, the last is to be preferred. Why?

Because the too thin sow fails to bring strong pigs and will fail in her milk early, as the extra food she receives to push the milk making will go on her back first. The nutrition of animals is such that first the dam must be supplied, then the offspring. This is evidently a survival of the fittest, as in the lowest order of animal creation, the dam life is often sacrificed to furnish food for the young until they become new moving creatures. The higher animals have past that sort of foolishness and now the dam cares for herself first and lets the thriftless farmer stand the loss of the offspring for his neglect. The over fat sow is out of condition, too, for she has received food of the wrong class and her digestion of fats has been excessive. She may easily be chilled and take scours. She has all the faults that we try to escape in a milk cow which we desire to be a milk producer.

The young pigs that are largest and strongest at birth continue to gain right along, the light weight chap-pies never overtaking them. Natural conditions are best for the sow and pigs, these are found in the alfalfa fields or in liberal feeding of alfalfa hay. Slop made of skim milk and a small amount of rolled barley or bran added to the waste from the kitchen, is an excellent feed.

This should be fed fresh daily; I do not believe in the swill barrel, but wish the milk sweet from the separator poured into the troughs and the meal dumped into it. Then the house waste of clean vegetable matter should be added. If there is more than the pigs can eat give it to the chickens, rather than let it sour.

Grain.

The sows with pigs receives only the

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

skim milk and grain at first. This is rolled barley two parts, bran or middlings two parts, corn one part, rolled barley two parts, bran or middlings two parts, corn one part; the corn can well be left out if it is high priced. This same ration is good for the sow's coming in, if fed in small quantities, the last week add a teacupful of flaxseed meal to the feeds. The flaxseed acts on the secretions and produces a good open condition that is favorable to young pigs. When the pigs are two week's old open the pens and allow the sows to have freedom enough for exercise. One of the losses in a piggery is in allowing the sows to farrow outside and overlay the young pigs.

This is guarded against by having a pig rail or fender on the pens, five inches wide and six inches from the floor or ground. The sow cannot get under this nor can she lay tight up against the wall to crush the little ones.

The Pen.

These pens are more desirable if made portable, for then the same ground is not used twice for the setting up of the pen for considerable time, this makes it free from disease germs. The pen's sides are made of close panels twelve feet long for the length of the building and eight feet long for the ends.

Two posts, twelve feet apart, seven feet high are set in the ground. Two posts six feet high are placed eight feet from these first ones to make the low side of the house. The sides are hooked on with ordinary door hooks and eyes to the outside of these posts, using three or four hooks on each panel to hold them from warping out of shape. The panels are four feet wide and may be made out of six-inch fence boards nailed to uprights, but be sure to put the uprights on the outside. Cut one of the shorter panels along the line of the uprights and hinge the piece for a door. The roof is in two sections and is wired to posts. The roof is made on a frame having enough cross pieces to make it stiff then the whole is covered with some kind of roofing paper. A number of short pieces of lath nicked to fit will be found of use to support the roof between the post along the side of the panels.

Advantages.

This pen is portable in a measure, it can be taken down and put up by two men in a couple of hours. The roof not reaching to the sides insure good air while the pigs are sheltered from direct drafts. In the extreme of a frosty winter, if too cold, nail sacks of single thickness around the open parts, the ventilation will still be perfect through the sacks. The fenders are placed on the panels and help to stiffen them at the bottom. If they are nailed securely in place they will not be forgotten when the pen is set up. The roof should set with the slope to the rain quarter. These pens for the sows are set directly on the ground in a level place, if there are spots of morning glory or other pests, the pen set up over them is a reliable cleaner of foul weeds.

Feeding.

The pig or pig melons afford a cheap

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

feed during the winter for sows and pigs. The seeds of these are sown along the roadways after the orchard cultivation is finished. The pig melon is hard and keeps well resisting frost and dampness better than pumpkin. While pumpkins have a greater food value, yet, both are needed, the pumpkins are fed first then the pig melons. These two furnish the cheapest form of green food during the period the alfalfa is resting. I find that most of the pig troubles are non-existing when

Farrowing.

At farrowing time it is well to be near enough at hand to see that the sow is not eating her pigs; this is common in California. "I am sorry to say that it is not always safe to buy a aged sow for fear she has this habit. When a sow does this, the only best thing to do with her is to put her into the fattening yard to make lard. There is only a little feeding needed at farrowing time, the authorities claim it is a source of annoyance to the sow, and fighting away she bites a pig and then eats it. In the pens described there is no feeding needed at this time. When

the pigs are little, a litter of leaves can be put in if the weather is chilly.

The slops fed the sow in cool weather should be warmed by having a can of boiling hot water poured over it. Using skim milk, one gallon to each pound of bran and two quarts of hot water and two tablespoonfuls of oil meal make good food for the sow in the winter. After the first week add some rolled barley and corn to it.

While the sow is giving milk avoid anything that is not sweet in her food. A melon or pumpkin freshly cut is good for her, but waste from the kitchen should be watched closely, if fed, as it may not be sweet. If there is any doubt send it to the grown pigs.

—M. E. Sherman.

California Live Stock Breeders Association

The California Live Stock Breeders received a most emphatic and deserved compliment from Prof. E. J. Wickson, of the State University, at a recent meeting in Sacramento when the professor gave to it much credit in that it was the most important factor in securing the appropriation which made the State University farm at Davisville a possibility. Dr. Wickson was present and expressed most hearty appreciation for the work done in securing legislative action, and expressed a desire to aid in every way the great industry represented by the men making up the membership of the association.

Dr. Wickson was not present because of being placed on the program, but being in the city he was, of course, requested to address the association. In fact, the doctor said: "This association is really the source of the life of the New University." The attention was also called to the fact that, at the time of need, when the State University was endeavoring to bring matters to bear upon the legislature at this much needed step forward could be made, this association did some exceptionally good work and thought about that which the State is so long needed. The State farm at Davisville was referred to as being nearly ready for preliminary work and the fitted inauguration of the short term from October to February Prof. A. Henry, of Wisconsin, is to be here for a course of lectures. The creamery which for the present will be under the direction of Prof. Major, professor of animal industry, will open on October 30th.

Prof. W. M. Hayes, assistant secretary of agriculture, Washington, was also present and gave a most instructive talk on the need of more agricultural education and called attention to the rewards of such education. He said that country life is more and more coming to its own, and more and more looking to it as one of the occupations offering brightest opportunity instead of being, as it has been considered in the past, the dullest of occupations.

The future of agriculture in California is great, for America is the star of the world, and California is the star of all America. Let us have a great country life as we have a great city life.

That the greater country life might prevail he appealed for broader education and for more careful and ex-

tended agricultural research. During the past quarter century \$25,000,000 have been spent in agricultural research. During the next quarter century if agriculture would keep pace with railroads and great financial and commercial institutions in its development there should be at least one half a billion dollars expended in this country along the same line.

Beside the appeal for deeper research he devoted much time to an appeal that the country school and high school should all open the door of agricultural knowledge wider than ever before. He referred to certain States where the consolidated rural schools were having great schools, the "kid wagon" going from various neighborhoods to the central school where greater talent could be centralized than in the separated rural district.

Mr. Hayes also appealed for organization along social and literary lines in country life. He said not only to use text books, but work with things. The present tendency seems to be to invest vast sums in "peace" by creating great navies and great armies. This he deemed wise, but also appealed for an investment in men as well as in peace. Broaden and deepen their knowledge of agricultural things and the greatness of this country will continue.

As to the breeding of animals he said that ten years ago animal-breeding was far ahead of plant-breeding, but now with Burbank and others having given attention to the matter of plant-breeding it has taken such advance strides that today it seems ten years in advance of animal breeding. He suggested as a practical aid in better and more intelligent animal breeding co-operative organizations wherein the very highest grade of animals of any particular type may be secured, and upbuild the character of the stock of the entire community.

G. A. Murphy read a paper on the brood sow from a most practical standpoint.

Prof. Carlyle spoke of the greatness of opportunity before California stock breeders, and to enforce it upon the attention of the members he referred to the fact that vast quantities of beef and pork are shipped through Colorado into California every year, and this in the face of the fact that California has capacity to produce the finest stock in the world under the best conditions. There needs to be a great awakening in this State along

this line that there may be less importation and more production of cattle, sheep and hogs. He spoke of the time when California won the name for producing the finest, fastest road and trotting horses in the world. Why has not this reputation been held and increased by not only producing these fast horses, but draft horses, beef, cattle and hogs.

We are continually going to Europe to buy the import blood for raising our grade of stock. This may be necessary, but why can we not improve within our own State boundaries by raising breeders who will be compe-

tent to grasp the problem of breeding the finest stock this world produces. He predicted that the next few years would see great advancement along the line of stock breeding in California.

The association did not hold an election owing to so many attractions keeping from attendance at the meeting a quorum. At present Mr. S. B. Wright of Santa Rosa is president and Prof. E. W. Major of the State University is secretary.

Eternal vigilance is the price of successfully combating the onslaught of weeds.

The Vegetable Garden

WINTER VEGETABLES.

BY most people winter vegetables are supposed to be grown in the winter time, while in reality, they are grown in the fall and are about ready for use when the chilly nights of December overtake them and all but stops their growth, except in the most sheltered places. There is some partial exceptions to this rule, of which peas, lettuce and turnips are the best examples.

It is always hard to get a good stand when planting in August and September, as at that time of the year there is but few or no tender greens, and, as a consequence, the birds eagerly devour the young plants as soon as they push their heads above ground. Where the planting is done on a large scale, the percentage of damage is not so great, while when only a small bed is planted the loss is apt to be a total one in which case it is well worth building cover beds; make a frame of six-inch boards, four feet by twelve or any other size desired, cover same with a wire screening of one-inch mesh, such a frame can easily be laid to one side or just raised up from one side at a time when any weeding or other attention is in order by making the soil rich and supplying plenty of water a most astonishing amount of stuff can be grown in this small space. It will give fresh vegetables almost every day in the season, which for health and relish are far ahead of anything we can buy. Where there are children they should be instructed to do the work and in this way earn a nickel in place of spending one. We, of this generation, think too lightly of the saving habit. We should teach our children how to earn a little cash and thereby make them self-supporting.—J. C. Ostergard.

OUNCE BETTER THAN POUND.

Preventive measures are always more practical than remedies, whether it be in fighting crop and fruit pests or diseases which assault the herds and flocks. In fighting fruit pests, it will be a great deal more effective to remove and destroy the infested fruit this year than to try to overcome the pest next year by spraying. This is especially true of the codling moth. Remove and destroy the worm-eaten apples as soon as they fall to the ground and there will be a great deal less of the trouble next year.

During a dry time a good supply of road dust should be gathered to a dry place, if the reader wishes to use it in combatting cabbage bugs. When it is needed the weather may be so wet that it cannot be procured. Fill up an empty salt barrel with the dust and set in the barn or smokehouse where it can be kept perfectly dry till it is needed. By adding about one part insect powder to ten parts of road dust will make a dust that will effectively destroy all three forms of the cabbage worm.—Journal of Agriculture.

When a strawberry plant is seen to be out of condition, it is best to examine into the cause. Ofttimes the notorious white grub will be found at work on the roots of such plants.

Hunt 'em out and kill 'em; not that the lives of such plants are saved in so doing, but that the rascal may not have an opportunity of destroying other plants.

If your neighbor is trying to get into fruit growing and needs help, give him all the suggestions you can.

TO DESTROY CABBAGE WORM.

A. D. McDowell, an Oklahoma gardener, writes: The green worm is the plague of our lives here. For some time we could not raise a cabbage because of the worms till a neighbor told me the following remedy:

Take alum and dissolve it in water and apply it to the cabbage with a common sprinkler as often as there are any worms to be seen. I find that a few applications are sufficient. This remedy is entirely harmless, not very expensive and is sure destruction to the worms. Make the solution quite strong with alum, the amount you can determine for yourself.

An Iowa gardener gives the following advice: We take a pint of barrel salt and dissolve it in a gallon of water. After the salt is thoroughly dissolved we sprinkle it on the cabbage with a common garden sprinkler. The result is we never have worm-eaten cabbage, while our neighbor across the road loses his crop nearly every year.—Farm Progress.

HOW NITROGEN IS LOST.

A good many farmers ask the question, how it comes that the soil on their farms loses its nitrogen and therefore wears out so readily. We can give one reason, crops are not rotated. No soil that will produce a variety of crops should be farmed continually with one crop. One writer has estimated that ten crops of one kind of grain will exhaust the best soil in the United States.

There are three well known ways, says Journal of Agriculture, by which soil may lose nitrogen. First, through the crops which are grown on and removed from the soil; second, by escaping into the air in a free gaseous form; and third, leaching out through the soil in the drainage waters as nitrates. Experiments show that many times more nitrogen is lost in the last two named ways than through the crop. It is not so much that which is lost through the crop that depletes the soil as that which is lost through the air and drainage waters.

The Minnesota station has shown by a recent experiment that thirty bushels of wheat per acre will remove something like forty pounds of nitrogen. If the ground be kept in wheat for twelve years there will be an annual loss of about 95 pounds of this element through the drainage waters and air. For every pound that is taken from the soil to make the crop more than two and one-fourth pounds are lost in the other ways named. It should be noted that this is true if the ground be kept in continuous cultivation to wheat.

When a rotation of crops is practiced in which clover is grown, live stock kept and manure used, the supply of nitrogen is maintained. There will be a certain amount of nitrogen lost through the air and drainage waters in spite of all that can be done to prevent it, but this can be more than returned by the growth of the clover and the application of manure.

The man endowed with a good supply of energy, determination, push and grit combined with love or aptitude for the business, is sure to win out in the fruit-growing business as in any other occupation.

THE "BOSS" Tree Protector

Made of Yucca Palm

Is cheap, durable and put on the tree. It protects against frost, sun-burn, hoppers or dry winds. Easily removed; will last years.

The Ornamental Garden

FLOWER GARDEN.

Preparation of ground for winter planting and material for enriching the soil according to the needs of plants grown are important at present," says a writer in the Journal of Agriculture of Victoria. Most of the summer and autumn blooming plants will continue to flower more or less this month, and little can be done but maintain neatness until the time arrives to prune, store or transplant the different classes.

In preparing new beds one of the most important considerations is, that the whole area is well under-drained. It is of even more importance than the character of the soil, for no matter what plant food a soil may contain, it remains inert and useless

Seeds of sweet peas may be sown now. The most suitable soil is a fairly heavy, well drained loam. Stable manure is a suitable fertilizing agent, also being of great benefit. Plenty of space should be allotted to each plant, the most common mistake being sowing the seeds too thickly. Plants of hardy annuals raised earlier in the year may be transplanted to their flowering quarters. A fair amount of room should be allowed for each plant, a great number of and far finer blooms being produced by a few plants well grown, than by a quantity overcrowded and half starved.

Bulbs of various summer-blooming species may be planted.

We lose much beauty in gardens by ignoring things like hops. We re-

The Arch on Mariposa Street, Fresno

in America. They have heard of the famous grapes of California, and they have seen many beautiful ones; but here they will find grapes to eat as well as to look at—grapes that are really as sweet and luscious as they

look. They will see a unique industry, in the raisin industry, and they will see all the other irrigation industries on an unexampled scale. Incidentally, they will be well entertained and have a good time."

It was all made good.—C. B. Messenger.

unless an effective system of drainage exists. Well drained soil when cultivated is always warm and moist—conditions positively necessary for the perfect development of plant growth. Organic matter in the soil is decomposed and made available for plant food by the action of air, with its elements, oxygen and carbonic acid gas, which is constantly in attendance on water moving through the soil. The proper depth to set the drainage material varies according to the depth of the clay or other sub-strata. In heavy retentive soils with a strong clay bottom, shallow drains set a few feet apart are best; in deep light soils the pipes or other drainage material will need to be placed in the clay no matter how deep it may be, to be thoroughly effective.

Where possible a compost heap or pit should be made in which leaves, stems and general garden rubbish may be partly decayed before being dug into the soil. Stable manure should be mixed through the compost and the whole mass occasionally turned over and watered if dry. Lime should not be added or any ammonia that may be present will be dissipated.

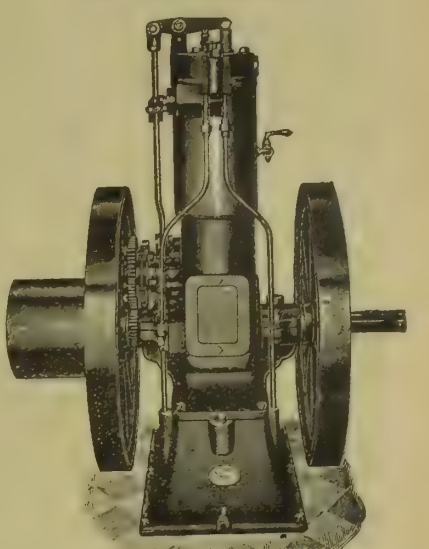

member a gnarled apple tree over which the hop had spread its vigorous shoots, and it would not have been easy to discover a prettier bit of free and picturesque growth. It makes a happy contrast to clematis, the mass of deep green leaves intensifying the color of the deep blue flowers.—Coleman's Rural.

An old negro who lives in the country came into town and saw an electric fan for the first time in his life. The whirling object at once attracted his attention and, after intently gazing at it for several minutes, showing all the while the greatest astonishment and curiosity, he turned to the proprietor of the shop and said: "Say, boss, dat suttlenly is a lively squirrel you got in dis heah cage. But he's shurely goin' to bus' his heart ef he keep on makin' dem resolutions so fas'."—Coleman's Rural.

Letters of inquiry concerning California addressed to the California State Board of Trade bring prompt answer.

SULPHUR CAN BE USED.

SECRETARY of Agriculture, James Wilson has given assurance that the fruit dryers will be unmolested in the customary use of sulphur for this season. This is well, and really all they ask, as before another drying season opens, it will be demonstrated that sulphur, as used here, is rather beneficial than injurious. It preserves the fruit, keeps it from injurious insects, and is not used in sufficient quantity to be injurious as a food. Our fruit men now have nearly a year in which to press these facts home on the chemists of the Department of Agriculture, and they will do it.

CLOSER INSPECTION NEEDED.

It is to be hoped that the discovery of a new pest to our State, recently made, and the panic it has caused, will have the effect of redoubling the vigilance of the County Horticultural Commissioners in their work of inspecting outside stock. There will undoubtedly be heavy shipments of nursery stock brought in from the East during the coming planting season, and as it is known that there are sections in which pests and diseases unknown to California exist, safety demands that the most careful scrutiny should be made of all outside stock, and none should be admitted unless it has attached to it an affidavit stating where it was grown. It is gratifying to note that since the White Fly alarm, several counties, which heretofore the Horticultural Commission regarded as an unnecessary body, have made appointments for the protection of their orchards.

LOOKING AFTER PARASITES.

Prof. Froggatt, of Australia, who holds a place in the front ranks of the entomologists of the world, has recently been on a visit to California on his way around the world. Prof. Froggatt was chosen to represent four of the Australian States, and one of the principal objects of his trip is to discover, if possible, a remedy or parasite for the fruit fly, which is one of the worst pests of Australia. Incidentally, he has made a tour of California, inquiring into the methods pursued here and investigating the work of the codling moth parasite, which he states has been grossly exaggerated by the newspapers of his country. He will visit points in the West Indies, Mexico, South America and Europe before his return. It is pleasing to note that California's system is being noticed by other countries and her lead followed by them.

STATE FAIR A SUCCESS.

The State Fair this year has far surpassed any ever before held. The great pavilion is well filled with exhibits of all the material productions of the State—Agricultural, mineral and manufactures. Twenty-one counties are represented, covering the extreme length of the State, from San Diego to Siskiyou. Public interest in it has been keen, and from the opening night vast crowds have been in attendance; on Friday night 15,000 people were present. At the agricultural park, interest was manifested in the stock and poultry exhibits. There were some good races, but this branch was subordinated to the general display, and was not made, as has here-

before been done, the whole show. It has been claimed that the races, with the consequent gambling, were the life of the State fairs and that they could not be carried on without them. The present management found the show moribund and ready for burial. It concluded that it was dying with the gambling feature in full blast and could do no more if it were cut off, and the experiment has been tried and with marked success. The exhibits are the largest and best ever made; the attendance the greatest on record, and there is a marked absence of tin-horn gamblers and fakirs whose presence has heretofore caused self-respecting people to stay away.

CAUTION TO TREE PLANTERS.

Tree-planting season is approaching again and very many orders for nursery stock are already being placed. There will again be a great call for all varieties of fruit trees, especially peaches, which our local nurseries will hardly be able to fill. A word of warning against tree peddlers will not be out of place. In giving orders for trees be sure to give them to some well established nursery, their agents or some one whose standing is known. There are traveling agents who will take orders for any kind of stock and supply it, usually below the regular rates, and too often after waiting and working for years for the trees to come into bearing, the purchaser will find that he as well as the trees have been sold and he has got something he did not want. Reputable nurserymen may make mistakes, but it is not likely; they can be reached and will make good; but the irresponsible peddler has gone, nobody knows where, and his patron will have to pocket the loss and the annoyance.

WHITE FLY BEING HELD IN CHECK.

Reports from the White Fly sections are still favorable. The State Horticultural Commission has men stationed permanently at both points from which it has been reported, and it is being carefully watched to prevent its reappearance. Daily reports as to the condition of matters are received from these officers, and so far there is no trouble to be apprehended. There is no question now but that the pest has been so far got under control that by constant vigilance, it may be kept in check, and quite probably eradicated.

FRUIT GROWERS' CONVENTION.

It has been definitely settled that the next Fruit Growers' Convention goes to Marysville. Arrangements for it are already in progress and the White Fly and its control will form a most important part of the matters to be considered. The people of Marysville have responded bravely to the demand upon them to sacrifice their trees for the benefit of the State, and it is believed that the discussions at the coming convention will show that their sacrifice has not been in vain and that it has been appreciated.

PEACH BLIGHT.

Peach blight has not been nearly so prevalent during the past season as it was a year ago, but it has still been reported from some sections. Peach blight is one of the fungous diseases, and its virulence depends largely upon climatic conditions. Nevertheless, in those sections where it has been bad it is as well to take precautions against its reappearance next season, and for this purpose, peaches should be sprayed with the Bordeaux mixture as early as possible. Anywhere from the middle of November to the middle of December.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance.

Our catalog tells all about it.

Mail us a card asking for it today.

With the Citrus Growers

YELLOW SCALE.

"FOOLS rush in where angels fear to tread," and since scientists dodge this issue so completely it seems to be high time that the "fool" should give information leading to the conviction of this pest regardless of its identity with, or inference from, the red scale, this being apparently the chief bone of scientific contention.

Prof. C. L. Marlatt has the following to say of this scale in Farmers Bulletin No. 172: "This insect (the red scale) has, in California, a rather well marked variety, known as the yellow scale, (*Aspidiotus citrinus* coq.). This variety does not differ in any structural feature from the red scale, the mature insect remains yellowish in color. This variety is attacked by quite a number of parasitic flies, which keep it more or less in check, so that it is not, as a rule, so abundant as the red variety."

Many local authorities claim that there is really no difference and that red and yellow scales are one and the same. Among inspectors a difference is recognized though their definition of this difference is not always quite consistent or satisfactory. They quarantine and mark for fumigation that which they call red scale and allow the other to go unmolested. As a general rule yellow scale is found only on leaves and fruit, especially on oranges and lemons, while the red variety attacks the twigs also and often becomes so encrusted on these that they are killed entirely. In the past, inspectors have been able to judge largely by the abundance of the infestation also. As suggested, the yellow scale is generally scant while the red increases rapidly after once getting a foothold. Formerly where yellow scale was found there was abundant evidence of parasiticism. The Chalcid Fly parasite has been especially effective and has kept the insect at a minimum. This lends color to the statement of Prof. Marlatt that there is really a difference since the red scale seems to be immune to these attacks and spreads with great rapidity.

Improvements in field practice, especially the universal adoption of fumigation, make it necessary at the present time to read just our views concerning this insect and I believe it would be a better practice for inspectors and fumigators to be instructed by the County Commissions of Horticulture to consider these scales as identical. In the first place there is always more or less confusion in distinguishing one from the other, for they are especially similar in the younger stages. A number of instances could be cited where a scant infestation of red scale has been allowed to remain because of the belief that it was the yellow variety, and others where growers have been required to fumigate with double dosage for the yellow. This invariably causes complaint from the growers and at once reflects on the ability of the inspectors where these gentlemen are really not at fault. Another difficulty always shows itself in the quarantine of one citrus region against another. In communities where red and yellow scale do not occur they are not willing to admit trees infested with either one, either because they believe that the two are identical or because they fear that the parasites will not be effective and will fail to be present at all in the different climate and conditions

in which the trees are to be transplanted.

A foreman in one of our large lemon packing houses advises me that more than seventy five per cent of the fruit relegated to a lower "scale" brand is affected with the yellow variety of this pest. This means nearly one per cent of the entire output and will thus figure well into dollars and cents in the loss in price obtained for this fruit. After much careful observation and discussion of this subject with inspectors and fumigators it becomes evident that the yellow scale has been increasing enormously in the last two or three years and that this is due to the universal practice of fumigation for black scale which kills the parasite of the yellow while it does not seriously affect the host. Many groves that I have visited show yellow scale not only present but general and abundant and doing serious injury to the trees. These are generally groves where rigid fumigation is practiced against black scale. While it is thus increasing in groves long infested it is also spreading to new fields and promises to become a serious problem for the future.

Fumigation for black scale cannot well be dispensed with for the sake of this parasite, or any other that we are at present blest with, but should rather be increased to red scale formula where either the red or yellow variety occurs.—B. J. Jones.

THE COMING ORANGE CROP.

It is yet too early to form a correct estimate of the coming crop, but to get something of an idea, the Cultivator has written a few growers and interviewed more. To sum it up in a few words "about the same or a little lighter than last year," is the general verdict. It is yet too early to judge of quality. Size will run smaller than last year, though that will yet be controlled, partially, at least, by later weather conditions.

Mr. Mills, of Arlington Heights Fruit Co. writes:

"It would be impossible for me to give you at this time an estimate of the coming orange crop. So far as Arlington Heights which I have covered during the last three days pretty carefully, is concerned, I believe that I am safe in saying that our crop is above the average and that we have more fruits if not more cars of fruit, than last year. We will have smaller fruit, as large a quantity we believe, in pounds, and much better quality because of better size.

"The lemon output on the heights this coming year will, we think, be somewhat better, but it is too early to make a careful and just estimate as to crops. They should not be estimated before October or November, say October.

"We can confidently say however, that we have a pretty fair crop of fruit on Arlington Heights for the coming season. As to the other portions of the section here, East Riverside, Highgrove, West Riverside and the lower part of the valley, I am unable to say at the present time."

Chas. R. Paine, of Crafton, writes:

"In my judgment, the coming orange crop of Crafton and of such part of Redlands as I have seen and heard about, promises to be greater in quantity and, mostly because of the greater number of the fruits of superior quality than for several years. Some doubt this, saying it

will be about the same as last year and that oranges have not set well inside, while the outside makes a good showing. Splits have just begun to appear; this and other causes of injury, including possible weather damage, makes predictions of little value.

It is pretty safe to say, that the crop will be a fine one."

Mr. Frank L. Palmer, of North Pomona says:

"Will say in a general way that the crop promises to be larger than the last, but not all uniform as to quantity."

J. H. Reed, of Riverside, estimates:

"My observation has reached over but limited area in my own neighborhood. Judging from what I have seen, we have a considerable smaller crop in sight now than we had at this time last year. The crops not heavily set to commence with; was severely depleted by the unusual July dropping, general in some sections, in single orchards only in others.

It is too early to know about quality, but I see no reason why we may not expect a crop of high grade."

A CHARMED LIFE.

Miss Elephant—"I wish you wouldn't keep looking behind you as if you believed you were pursued. You never see me doing it."

Miss Rabbit—"No; your left hind foot doesn't happen to be in demand as a vestpocket charm."—Woman's Home Companion for June.

WICKSON APPOINTED.

On Tuesday, September the 10, at the regular meeting of the Board of Regents, Professor E. J. Wickson, upon nomination by President Wheeler, was elected to be Director of the Agricultural Experiment Station, which makes him head of the department of agriculture in the university. Professor Wickson began his connection with the university in 1879 as lecturer in dairy husbandry. In 1885 he became lecturer on practical agriculture, and in 1891 was promoted to the associate professorship of agriculture, horticulture and entomology, and given charge of the Farmers' Institute work. This position he held until his elevation to the professorship of agricultural practice in 1897. Since May, 1905 he has been acting director of the university experiment stations, and dean of the college of agriculture. Professor Wickson has been connected with nearly every branch of agriculture in the State of California, and has probably done as much as any one to promote its interest in this State.

The State Fair for 1907, which closed last week, was one of the most successful in the history of the organization. Its exhibits were more numerous and of a better quality, while the attendance is larger than in many former years.

BEEF PRICES TO GO UP.

We are confronted by the prospect of another rise in the beef market. Local dealers say there is no cause for it; that is another cinch of the beef trust which is only felt in trust-controlled markets and has not been uniform throughout the country.

Secretary of Agriculture Wilson declares that there is a shortage of cattle, that the meat packers are paying on an average of 15 cents more per head on cattle and that this is the reason why the public is being compelled to pay an average of 3 cents a pound more than formerly for the various table cuts.

A representative of the stock-raisers of Texas, declares that the stockmen are not getting the 15 cents, and that Mr. Wilson's entire argument is falsely premised, since the increase in meats has been felt only in trust-controlled markets and has not been uniform throughout the country.

Secretary Wilson further declares that "the American people are eating more meat today than ever before in their lives. That French King who boasted that his country was so prosperous that his humblest subject had a fowl in the pot every Sunday would cut a small figure in America today. The American workingman has meat every day and, as a matter of fact, most of them have meat for breakfast and dinner.

"Now, with all this constantly increased demand for meat, the price is going up because there is not an increase in the supply of cattle in proportion to the increased demand. There is an enormous export trade, which cuts a great hole in the supply. Last year we sent abroad more than \$323,000,000 worth of animals, meats and animal products. The farms and the ranges are not increasing their supply of cattle proportionately.

"It costs more to raise cattle now. The price of farm labor has risen enormously. The great commercial prosperity of this country has drawn every available farmer boy and farm hand to the cities to work in our factories, in our shops and in all the many forms of industrial activity. A farmer is now compelled to pay wages to his farm hands, that proportionately, are just as high as are the wages that builders and other employers pay in the cities.

"The price of grain has gone up, and the farmer can make more money raising grain or hay or other crops that he can harvest with labor-saving machinery than he can in raising and fattening cattle for the market. Possibly, too, not so many cattle reach the market now because the rigid inspection of cattle, under the meat-inspection law, makes it useless to send to the market cattle that might formerly, perhaps, have passed. At all events, the supply has not increased as much as it ought."

All which Secretary Wilson says may be true, but it is going to be hard on the working man. He will have to learn to eat vegetables in greater quantities and depend less on meat.

CARE OF FARM MACHINERY.

Riding through the country by private conveyance, or on the train, one cannot fail to note the carelessness of the owners of farm machinery in permitting costly implements to sit in the sun and night fogs, wholly unprotected. We have often heard it said by experienced farmers of the better class, that there is no greater source of loss to the average farmer than that which comes to him through proper lack of attention to his farm machinery.

Recently we noticed a threshing outfit costing, at least, several hundred dollars, standing out in the sun where it has been left over a month. This machine including engine and all will, no doubt, be left where it is through the entire season. The loss to that one outfit will be greater than the wear for a full season. When the work with any machine has been finished, it should be thoroughly cleaned and all parts that are likely to rust should be carefully wiped with an oil rag or waste. They should then be stored in a shed of some kind, rather than left in the corner of a field or under a tree where the rain in winter will cause the bolts to rust, and the hot sun to loosen them, and render it necessary to expend \$50 or more on it before it is in condition to use

again. With good care and housing an ordinary machine ought to last ten years, but as they are too frequently cared for, or not cared for, they wear out in from five to six years. Here is a loss of 50 per cent on the machine direct to the owner. It is no wonder some farmers do not care in the world. As a general rule, the prosperity of a farmer may be estimated by the way he cares for his farm tools and machinery.

Poor care indicates shiftlessness, waste, lack of energy, and that the owner must necessarily have more tools and implements in a short time. Good care, on the other hand, indicates prosperity, development, bank deposits and the buying of farm machinery. Plows, harrows, binders and tools of all character should be thoroughly cleaned and oiled when laid away, or not in use, and protected from the weather by being housed. A good shed can be built for \$200, perhaps less, and the expense of such a shed will be returned in a handsome interest to the owner of the machinery.

In the grain fields of California it is to be noticed negligence of farmers in caring for the machinery a good deal more than ought to be. Economy in the care of all implements will bring big money saved to every farmer who practices that economy.

THE BUSINESS SITUATION.

There is a very general disposition to look forward to a season of improved business conditions. There was complaint of depression in certain quarters during the month of August but it is believed that the climax has been reached. Trade journals and circulars issued by financial houses it is the feeling that the worst has been passed. It is believed the period of liquidation in the stock market has about ended. Secretary Cortelyou has decided to furnish money from time to time to the national depositories which will relieve local situations. The West will need the money to move the crops and the same will be forthcoming. The world at large is going to need the crops of the West and the crops will be delivered at prices which will cause the Western farmer to smile.

In the industrial world every one seems to be at work. Wages are high. The great steel mills of the country are running night and day and are unable to keep up with their orders.

There are few clouds in the sky and even those which are discernible are not suggestive of a storm.

MAKE THE RESERVES PRODUCTIVE.

In speaking of the Forest Reserves, Governor Pardee said at the Irrigation Congress: "In setting these forest lands aside, the government does not intend to remove them from the use of the people. On the contrary, it is the government's intention, and it is now so doing, to make the forest reserves as productive a source of wealth to the people of the country as the German forests are to the German people.

"In the State of California alone there are something like 22,000,000 acres of forests reserved under control of the government; that is about one-fifth of the area of the State. In the United States the forest reserves area is considerably larger than the whole State of California and it ought to be much larger. Although these reserves have been under government control for but a very short time, they have already begun to return good values to the people of the country. For instance, in the fiscal year 1904-05, the revenues of the forest reserves from the sale of timber were \$60,142.62; while, for the year 1905-06 the returns were \$767,219.96—over ten times as great. Over 96,000,000 feet of lumber were sold from the reserves in 1905-06. The price of this lumber, on a "stumpage" basis, also increased from \$2.50 per thousand feet to \$4."

A market for prairie dogs has been opened up in South Dakota by the request of an English hunting club for 3000 of the little animals, which it is proposed to hunt in place of rabbits. The only goes to prove the old saying that "every dog has his day."—Journal of Agriculture.

If a market were opened for California squirrels and gophers a thriving industry in the miserable little pests would be built up. A large number of men and boys, not otherwise employed, could find steady engagement.

Agricultural Notes of the Pacific Coast

Northern California

Buyers are demanding cleaner picking by the hop pickers of Sonoma county.

The peach crop of Sutter county is ahead of all expectation in size and quality.

The Western Creamery Company, of Benicia, has a buying station in Woodland.

Yolo county reports the finest grain crop in years. Corn is an especially heavy crop.

One poultry keeper in Glen county gathered 10,548 eggs and sold them for \$213.77.

San Francisco boasts a dairy depot costing \$60,000, said to be the finest on the Coast.

"More hop pickers than ever before in this valley" is the report of the Ukiah Times.

In Mendocino county prune trees are being dug and vines planted in their place.

Solano county is making a grain return record this year which beats all previous records.

The Veterans' Home in Napa county has over four thousand chickens in its poultry yards.

Ukiah made one shipment of one thousand head of beef cattle by special train last week.

The vineyards of Napa county never promised better returns than they do at present.

Warehouses in Lincoln, Placer county, are already filled with a big hay and grain output.

Distemper has broken out among horses in Tehama county. At Bohemia several have died.

The county line between Placer and Nevada county is being established by a corps of engineers.

The weather at Ukiah has favored the hop pickers and work is progressing very satisfactorily.

The wheat crop of Butte county is said to be excellent this year, while barley is exceptionally heavy.

Planting the raisin grapes near Arbuckle, Colusa county, is to be extended more than ever before.

At Sacramento last week, was organized an association to become the guardians of the State's rivers.

The creamery at the State Farm near Davis, will be in charge of Mr. Hagerman, recently of Fresno.

Marsh hay raised in Solano county on reclaimed land is said to be exceptionally fine and profitable.

The hop crop of Mendocino county is turning out better than was expected, but small grain is short.

Employees of the Newman ranch have contracted anthrax poisoning through skinning diseased animals.

Grape growers in Nevada county say that the continual cool weather will prove rather disastrous to grapes.

Ukiah hop growers claim that eight cents which is being offered barley lets them out with cost to production.

The grape growers of Woodland held a meeting last week to secure, if possible, a better price for wine grapes. So far it is claimed the prices have run to little over \$16.

Central California

Fresno wineries are running full strength.

Barley is running very heavy in Monterey county; some sacks will run as high as 20 bushels.

From Tulare, in 1901, 600 pounds of butter were sent to market daily. Now the daily shipments are 4500 pounds.

The grape crop at Hanford and the country about, is in fine condition and excellent prices are realized by the growers.

Green grapes are bringing \$2000 a car in the Fresno district and from 11 to 12 cars are going forward daily from Fresno.

The San Joaquin bean crop is about one-fourth of that of last season. beans which will make thirty-five bushels per acre.

Grain in Madera county is yielding an exceptional crop this season. One firm will realize 12,000 sacks of wheat and 3000 sacks of oats.

Cheese is becoming an important product in Kings county. One man, B. Martella, makes 200 pounds a day which brings him in \$30.

The hop kiln belonging to Mrs. Wright near Santa Rosa, was destroyed by fire last week. Over \$1000 worth of hops were burned.

The rural mail delivery out of Bakersfield is increasing rapidly, showing that the county around about is settling with newcomers.

The San Joaquin County Japanese Labor Union is successful in holding up ranchers of that section to \$2 and \$2.50 a day for grape pickers.

Forest fires have been raging in sections of the San Joaquin valley this week and much valuable timber has been destroyed in the hills.

More than \$20,000 worth of lots in the town of Corcoran were sold last week. The new sugar beet factory has caused a boom at Corcoran.

Grasshoppers which have done much injury to alfalfa fields in Stanislaus county, are dying off in great quantities, supposedly from parasitic poison of some nature.

In the San Joaquin valley, all fruit crops have been big this season, except apricots, almonds and cherries, and it is estimated that the returns to the growers will be 25 per cent greater than last year.

R. S. Ralls, a Delano resident, believes he has discovered the road to wealth in a rich borax ledge which he has found in the hills east of Porterville and which he values at \$500,000, so says the Bakersfield Echo.

The grape yield in the San Joaquin valley has been very heavy this year, but the scarcity of pickers has been a drawback. There, as elsewhere in the State, the Japanese who contracted to do the work at certain prices, waited until the grapes were ready and then demanded from 75 to 100 per cent more pay. In some places where the different varieties ripen at different times the growers have formed a co-operative working force, all using their available force to pick the crop of one man when it is ripe. By this method it is possible to pick each crop just when it is ready.

Southern California

Anthrax is appearing in a dairy herd in Yucaipa valley.

The celery crop of Orange county is promising, exceedingly well and early maturity is promised.

The Celery Growers' Association is in better condition than ever before and will handle a large crop.

Less than one hundred cars of oranges now remain in Southern California for this season's shipment.

With a slight increase in price for beef, and the prediction for still greater price, the stock industry will doubtless receive an impetus.

San Dimas Lemon Association has shipped a carload of lemons to San Francisco and from that point they will be reshipped to Japan.

A large fruit buyer at Redlands, after a look over Southern California, reports a fine quality of crop setting, also that the quantity will be fair.

Commissioner Cundiff, of Riverside, has worked out a formula for new emulsion, which is said to be cheaper and more effective than any heretofore used.

Rangers in the forest reserves claim that great damage is done by the tree squirrels digging and destroying acorns and other nuts planted by foresters.

Recent frosts in the mountain apple growing districts back of Redlands caused some concern as to damage to the crop, but "no damage" is the report to this date.

Special Agent Woglum of the Bureau of Entomology is to conduct a series of experiments in fumigation which it is hoped will lead to large advantages to those compelled to fumigate.

Ranchers of Districts No. 6 and 8 in Imperial valley, which is cut off from the irrigation supply by last winter's floods are preparing for water which will arrive in a short time.

An announcement is made that the State Board of Fish and Game Association will use hunters' license money in introducing of wild turkeys in the forest reserves of Southern California.

Glendora Citrus Fruit Association shipped two hundred and ninety-one thousand boxes of oranges the last season and paid to the grower \$276,000. Packing and other expenses amounted to \$70,000.

The display of products from the irrigated districts, outside of California, was very meager at the National Irrigation Congress. Oregon, Utah and Idaho were the only States to send exhibits.

The tomato harvest in La Habra and East Whittier districts will begin Sept. 15. There are about six hundred acres planted in that district. Last year's price averaged \$40 per ton. One hundred thousand is the expected return from this section.

The Coachella Valley News has compiled some interesting statistics regarding the output of that section and among them we note: 63,000 crates of cantaloupes, 27,500 crates of onions, 220 tons of cabbages, 4400 crates of squash, 16,000 crates of tomatoes, 6000 crates of cucumbers, 424 sacks of beans, 4256 crates of grapes. The aggregating value is about \$150,000.

The Coast

The peach crop around Roseburg, Oregon is very heavy.

Spuds are selling at Portland at \$1.00 to \$1.25 per sack.

The Eugene cannery is paying \$30 per ton for Bartlett pears.

New Zealand exports butter to the extent of \$10,000,000 a year.

The grape crop of the Willamette valley has some of the finest in years.

At Coleville, Washington, a heavy rain ruined much standing and cut grain.

Eastern buyers are readily taking up all of Oregon's offering of wool at good prices.

One hundred and seventy thousand bales of hops is said to be the output of Oregon this season.

Oregon's output of wheat amounts to fourteen millions of dollars while that of her fruit four millions.

Unless prices change many fields of hops will be left to rot on the vines in Yakima, Washington.

North Yakima ranchers are clamoring for more water from the irrigation company which supplies that section.

It is estimated that fifty thousand bushels of grain were injured at Cunningham, Washington, in the recent storms.

The Cascade and Heppner reserves in Oregon are soon to be thrown open to settlement. The distribution will be by lottery.

The largest single deal in ranch lands in Montana was the recent sale of twenty-six thousand acres of sheep ranch at \$10 per acre.

A government agent is in the field near Pullman, Washington, overseeing the threshing of timothy, which seed the government is buying in large quantities.

An immense party of claimants for land in Northeastern Washington, stood in line recently in order to secure a part of lands thrown open by the government.

Thirty acres of wheat, yielding 90 bushels to the acre, has been raised and is being harvested in the little town of Juliaetta, 15 miles from Lewistown, Idaho, although nearly one-half of the crop was winter killed.

The crop of hops in Oregon is said to be very heavy and prices thus far have run low, many contracts being made at nine cents. At present, however, growers are standing together and it is confidently expected a higher price will prevail.

The crop this year is estimated to be the largest in the history of the section on the Nez Perce prairie and down in the Idaho county grain lands. The total crop in the Lewistown country has been conservatively estimated at 10,000,000 bushels for this

Three years ago A. Adams brought from British Columbia to Lewistown, Idaho, a single head of wheat. This he sowed and reaped about a quart of grain. The second season Mr. Adams secured enough to sow a quarter of an acre and the third season had secured enough grain to scatter very thinly over 30 acres. Nearly 50 per cent of this was winter killed, but from the 30 acres he will harvest 2700 bushels, or an average of 90 bushels to the acre.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledge standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet, "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. *crillmoro.* Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practiced nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POULTRY AT CALIFORNIA STATE FAIR.

THE exhibition of poultry this year at the State Fair was a fine representation of the poultry industry of the Pacific Coast. Although the fair was held at a time (Sept. 9 to 14) most unfavorable to both old and young stock, yet we found many specimens that were in good show condition.

When we go into our yards and see the ragged condition of our breeding stock, and the unfinished appearance of our young birds we wonder how any one could make a show so early in the season. But there is the breeder who always has out his early birds and who takes special care to condition his old stock that he may be able to take advantage of the early show and either furnish or show the prize winners.

New Building for Poultry.

The management of the fair told us this year that they were going to make this the best yet and they "made good."

Heretofore, the poultry has always been cooped at the pavilion in Capital Park, but by good management and hard work of the board it was able to secure an appropriation for a building and coops for the poultry exhibition, which was erected in Agriculture Park. While the appropriation was too small to erect a building suitable for the poultry exhibit, yet by the generosity of the public-spirited merchants of Sacramento who furnished material at actual cost the State has today one of the best appointed houses for the exhibitions of poultry on the coast. No money was wasted in making a showy or pretentious building, but every effort was made to have perfect light and ventilation, and we wish to congratulate the committee in charge for its efforts.

Exhibit.

As was expected, the Leghorn class was the largest in the show, which was headed by the Whites containing 111 birds, all good ones, too. The winners could have been taken out of the class and we would have still had a strong class. The first prize cock, though not quite at his best was pronounced by Judge Berrar as the best and most typical Leghorn ever shown in California. The bird was pure white with good head points, fine carriage and well finished. The first cockerel, another splendid bird, was large and well developed and in good show condition. First hen, another grand specimen, pure white, good carriage; splendid head points, good back, and tail carried at the right angle. First pullet good, fully developed and at her best.

Barred Rocks was another good class showing many well developed, well conditioned birds, with honors well divided.

Orpingtons, another large class containing many choice specimens. The Buffs were especially worthy of mention, and contained many old campaigners and prize winners. A bird to win in this class had to be above the average.

The Polish and Hamburg classes were well represented and, as a whole, made a splendid showing.

Bantams were one of the attractions of the show and were represented by many varieties, comprising Golden Sebrights, Silver Sebrights; White Polish; Buff, White and Black Cochins, Black Breasted Red, Red Pyles, Golden and Silver Duckwing Games and Japanese Silkies. The exhibit was above the average in both quantity and quality.

Awards.

Light Brahmas, Mrs. E. F. Reid: Cock 1, 2 and 3; Hen, 1 and 3; cockerel, 1, 2 and 3; pullet, 3; pen, 2 and 3. Mrs. F. M. Newbert, hen 2; pullet, 1 and 2; pen, 1.

Barred P. Rocks, Ivy Green Poultry Farm: Cock 1; cockerel, 3. Mrs. D. A. Robertson, cock, 3; cockerel, 2. M. Bassett, cock, 2; hen, 1, 2 and 3; pullet, 3; pen, 1 and 2. T. J. Simpson, cockerel, 1; pullet, 1 and 2.

White B. Rocks, T. J. Simpson: Cock, 1; pullet, 1 and 2. H. A. Land, hen, 1, 2 and 3.

White Wyandottes, James Stanfield: Cock, 1; hen, 1; pullet, 3; pen, 1. C. R. Fontana, cock 2; hen, 2 and 3; cockerel, 1 and 2; pullet, 1 and 2.

Partridge Wyandottes, M. Coffey: Cock, 1; hen, 1 and 2.

Columbia Wyandottes, A. W. Casselman; cock, 1; pen, 1.

S. C. R. I. Reds, J. D. Canney: Cock, 1, 2 and 3; cockerel, 1, 2 and 3; hen, 1 and 2; pullet, 1 and 2; pen, 1 and 2. Sanitary Poultry Farm, hen, 3; pullet, 3.

Buff Orpingtons, G. W. Gessner: Cock, 2 and 3; cockerel, 1, 2 and 3; hen, 1, 2 and 3; pullet, 1 and 3; pens, 1, 2 and 3. Martin, cock, 1; pullet, 1.

White Orpingtons, G. E. Meadows: Cock, 1 and 2; pullet, 1.

Black Orpingtons, G. W. Gessner: Cock, 1 and 2; cockerel, 1; hen, 1 and 2; pullet, 1 and 2; pen, 1.

S. C. Brown Leghorns, Percy Ward & Sons: Cock, 1; hen, 2; cockerel, 1; pullet, 2; pen, 1. Geo. Colby, hen, 1; cockerel, 2; pullet, 1 and 3.

S. C. Buff Leghorns, Percy Ward & Sons: Cock, 2; hen, 2 and 3; pullet, 1. J. S. Meadows, cock, 1; hen, 1; cockerel, 1 and 2; pullet, 1 and 3; pen, 1.

S. C. W. Leghorns, F. E. Baldwin: Cock, 1 and 3; cockerel, 2; pen, 1. C. B. Carrington, hen, 3; cockerel, 3; pen, 3. N. T. Carpenter, pullet, 1. Geo. Colby, pullet, 3; hen, 2. Mrs. F. M. Newbert, cock, 2; cockerel, 1; hen, 1; pullet, 1; pen, 1.

R. C. W. Leghorns, Lorenzo Hurd: pen, 1 and 2.

Anconas, Percy Ward & Sons: hen, 1, 2 and 3; pullet, 1 and 2; pen, 1.

B. Minorcas, M. Bassett: Cock, 1; hen, 1 and 2; cockerel, 1 and 2; pullet, 1, 2 and 3; pen, 1.

Wh. Minorcas, G. L. Meadows: Hen, 2. James Cecil, cock, 1; hen, 1; cockerel, 1 and 2; pullets, 1; pen, 1.

Blue Andalusians, L. A. Wilson: Cock, 2; hen, 1; pen, 1; cock, 1;

ECHOES FROM THE ALLEYS.

B. Carrington made a splendid exhibit of White Leghorns. Her 3rd prize pen was easily the best pen in the show, but had to be placed at the bottom on account of male head-pen carrying tail to one side. We do not consider him as having a rye tail, but a weakness and the judge

could not do otherwise than leave the pen third.

M. Basset, of Hanford, made good winning on the Barred Rock class, carrying off two blue ribbons and a number of second and third prizes. He also won on Black Minorcas.

Mrs. E. T. Reid of San Francisco, showed a fair string of Light Brahmas.

R. A. Rowan, of Pasadena, whose exhibit contained 112 birds carried away many regular and special prizes. The exhibit was in charge of S. Tyler the veteran judge and breeder.

Mr. Huntley of Petaluma, exhibited some of the finest Alesbury ducks that we have seen. This breed, no doubt, is new to many, yet it is one of the oldest English varieties. It is one of our largest and stands at the head for marketing purposes.

Mrs. F. M. Newbert, of Sacramento, sprung a surprise in the White Leghorn alley, by winning four first prizes. Mrs. Newbert's success is the result of hard work and study. Her birds are the true Leghorn type.

W. S. Sullivan, better known as Buff-Orpington Sullivan, took about everything in sight on his buffs. He not only knows buffs, but knows how to mate, breed and condition a bird for the show room.

Petaluma Incubator Company made a good exhibit of incubators, brooders and appliances, winning the award for best exhibit.

Frank E. Baldwin, San Jose, Single Comb White Leghorn specialists, was one of the happy exhibitors of the show, winning 1 and 3 cock, 2 cockerel, 2 pens. Mr. Baldwin made an exhibit of 31 birds, not a bad one in the lot. We are glad to reproduce for our readers, pictures of Mr. Baldwin's second prize cock and second prize cockerel. We are sorry that we could not give a picture of the first prize cock; he, like the second cockerel, was not at his best, but shows splendid form and when his tail is a little more developed will show much better. This bird has almost perfect head points, good yellow legs, is strong and vigorous. The third cock was another good bird, though not so good in comb.

While Mr. Baldwin breeds exhibition birds, he does not neglect the utility side. His houses and yards are considered the most practical that we have today, he uses the open front house with two yards to each house; in one he grows wheat while the birds are kept in the other. When the wheat is about 6 or 8 inches high the birds are turned on it, and wheat is sown in yard number two. This always keeps the ground nice and fresh as well as supplying an unlimited amount of green food for his birds.

Mr. Baldwin's ranch comprises 3 acres all yarded and devoted exclusively to poultry. He has at present about 1500 birds.

As a whole the exhibitors were a fine representation of the industry, not a "grouchy" one in the whole bunch. The judging was done by Judge Henry Berrar, of San Jose, Robert Venn of Fresno, Mr. Mitchell of Sacramento and Frank H. Thomas of Los Angeles.

MONTHLY MEETING LOS ANGELES COUNTY POULTRY ASSOCIATION.

The regular monthly meeting of the Los Angeles County Poultry Assn., was held at Unity Hall, Sept. 7th. President Sly called the meeting to order at 8 p.m. There were about fifty present, one-third of whom were

Hen Fruit Pays. If you want more, feed

Egg-More

Poultry need to be fed a scientifically balanced ration as much as any other stock. Egg-More is just the thing to mix with good grains to make the same a rightly balanced ration. It is highly nitrogenous, very rich in protein, will keep the hen in good health, sustain her system properly, and enable her to lay lots of eggs when they are scarce and high. Just a little fed daily with good grains, or even with bran, as directed with each package, will do it. It can be fed either dry or as a mash. It contains no cheap filler; the hens like it, they eat it, there is no waste. It makes the cheapest Egg Food especially if you can buy your grains at home cheaper than to ship them in. Many so-called "poultry foods" and "egg-makers" are nothing but stimulants and not advisable to be fed regularly. Egg-More is not a strong tonic and stimulant, but merely contains enough condiments to give the food relish and keep the fowls in fine fettle. It will pay its cost many times over in the increased egg yield. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

ladies. One of the pleasant features of these meetings is the large attendance of ladies. The meeting was a very pleasant and instructive one. President Sly called upon Mr. William H. Humphrey for the first address. Mr. Humphrey's subject was, Soil, Climate and General conditions for poultry culture in and about Los Angeles. His talk was very useful to those who were looking for locations and very instructive and entertaining to all. We will not attempt to quote from his address as we could not do it justice, but suggest that the reader attend the next meeting and hear Mr. Humphreys who will speak again. The second speaker was Mr. Chas. H. Kline of Burbank, he told how he had started in the poultry business with a small capital and how he had persevered until he had built it up to its present condition. This year he stated he had hatched some 15,000 chicks, and cleared over \$1700, mostly from sale of eggs. He keeps the White Leghorns. His talk was practical and encouraging and was enjoyed and appreciated by all. Mr. Schofield of the Gardena Hatchery gave a short talk and invited all interested to visit his place. He said he was conducting it upon entirely different principles from anything of the kind in the United States. Mr. Schofield will be one of the speakers at the next meeting, and Mr. McLaughlin also will give his experience in hatching thousands of chicks.

These talks should not be missed by anyone interested in poultry. Others gave short talks and the chairman requested those who desired to ask questions of the speakers.

Many availed themselves of the opportunity.

The next meeting will be held in October, the time and place will be announced later in the Cultivator. The following program has been arranged by Secretary Hubbard.

MRS. A. BASLEY—A Talk on Poultry.

MRS. C. D. HUBBARD—Building an Adobe Incubator, and Running it.

WM. M. HUMPHREY—How to pick out, condition, and prepare your show birds for the next big show.

F. T. M'LAUGHLIN—White Wyandottes and how to raise thousands of chicks profitably.

JOHN D. MERCER—Indian Games.

MR. SCHOFFIELD—Of The Gardena Hatchery—Brief report on how first big hatch of season came off.

C. D. HUBBARD—Brief report on the progress the directors have made toward the next show. Dec. 5-14, 1907.

Free distribution of a few Poultry magazines.

THE SOCIAL HOUR, devoted to getting acquainted.

L. D. HADLEY, Solo, "The Call of the Turkey."—John D. Mercer.

CHICKEN POX.

The following article by Mr. Hawkins was inadvertently omitted from our last issue.

Numerous inquiries are reaching me concerning a disease not uncommon at this time of year—Poultry Favus—or what is usually known amongst poultry keepers as chicken pox. As the outbreak this year is apparently so widespread, it would appear opportune to briefly describe the symptoms and methods of treatment, as by neglecting the disease in its early stages the birds become emaciated and fail to respond to treatment.

One of the principal causes of this complaint is that of over-crowding in damp or filthy runs and houses. The disease usually attacks young birds, especially those hatched late. It rarely affects adult birds; and the breeds which are most subject to it are: The Cochins, Brahma, Orpington and Wyandotte, and very often those breeds which carry heavy combs, such as the Leghorn, Minorca and Dorking. Many fine specimens of the latter breeds lose the tip of the spike, especially if the affected birds are not hobbled. The disease is one that greatly irritates, and the more the birds scratch the parts affected, the more rapidly do the spores spread, until the birds become a mass of sores or, what appears to the casual observer, warts. The first symptoms which every amateur may detect are loss of appetite and a great thirst. The birds should at once be isolated and allowed no water for two days at least, and be given only soft food (pollard and bran moistened with skim milk) and plenty of finely cut raw onion.

Minute, pale yellowish spots, cup-like but irregular in form, appear on the comb, often on the wattles and at times on the eyelids. The latter are the most troublesome to deal with,

and it is absolutely necessary that the birds should be hobbled. This can be done by tying a piece of tape around the ankle—the joint just above the foot, and below the fourth toe—except those breeds having five toes such as the Faverolle, Dorking and Houdan breeds; in these cases the tying should

Second Prize Cockerel

California State Fair

Bred and Exhibited by Frank E. Baldwin

be between fourth and fifth toes so as to prevent the tape slipping up the shank.

Remedy: Bathe the head and face with a weak solution of permanganate of potash. Make a paste of the following and apply to all parts affected:

Scene on Frank E. Baldwin's Poultry Farm

Sufficient sulphur to fill a small pill box, enough boracic acid that will go on a threepenny-piece and five drops of eucalyptus oil with sufficient soft soap or vaseline to make a paste, mix thoroughly together and apply with a small camel hair brush. Do not allow the hands if cut or scratched to come in contact with the crusty wart. A good and safe preventive from contagion is to use an antiseptic, consisting of either a three per cent solution of phenyle or lysol, in which the hands should be rinsed. All houses should be thoroughly fumigated with burnt sulphur and floors sprinkled with lime. With care there need be little to fear, but children should on no account be allowed to handle the fowls so affected, neither should any person with an injured finger, as the disease is far from pleasant. The irritation and sudden sickness which follow are most distressing. Four or five days will effect a cure when it will be seen that the crusts will fall off and the birds' appetites will return. A tonic in the water should at once be given viz.: To two gallons of water add 80 to 90 drops of sulphuric acid (poison) and one and one-half to two ounces of sulphate of iron; allow same to remain a few hours, after which stir well and give all the birds

on the farm as much as they will readily drink. This will prevent the disease spreading and will tone up the flock.

Although the complaint is not serious, yet if neglected it is sure to turn to that dreaded disease—roup—attacks of which are more often fatal than any other ailment of poultry in Australia. Damp houses are the primary cause; crowded yards, such as are often noticeable in our suburban areas, are also responsible for serious complaints, especially at this time of the year. I would again turn my mind to the absolute necessity of sweeping up the droppings daily and of the urgent necessity of sprinkling lime about the yards; more than twenty birds should be kept in a yard of less than 50x25 feet, at least, the more crowded they are the less profitable will they become. Remember, that a few good birds of noted laying strain will return a greater number of eggs than a large flock kept together. This has been exemplified over and over again, in the egg-laying competitions throughout Australia. To those desirous of keeping a few birds to supply the household with quail eggs, I cannot do better than urge them to secure a brood hen as soon as possible, and thus secure the early chick and immunity from chicken pox.—Journal of Agriculture of Victoria.

POULTRY AND FRUIT.

A combination of fruit growing and poultry raising is especially recommended in a bulletin from the Pennsylvania Department of Agriculture. Locate the poultry houses, if possible, so that the runs will be in the orchard. The fowls will destroy

thousands of harmful insects, thus greatly benefiting the trees and increasing the prospects for fruit, and the fowls will at the same time gain great comfort and benefit by the pro-

John L. Jr.

Third Prize Cock

Bred and Exhibited by Frank E. Baldwin

teeting shade of the trees. Plum trees and cherry trees are especially benefited by the presence of fowls about their roots. Peach trees will grow most rapidly and soonest give an abundant shade.

Bees and Their Care

FORCED SWARMING.

EXCELLENT results are often obtained by swarming the bees in this manner: After you have had your first natural swarm or two, and you are sure that swarming time has arrived and you do not wish to watch a month or more for swarms, just finish them up in a day or two. Go to the hive that you have decided to swarm artificially and remove it from its stand, putting in its stead a hive containing four or five frames with only starters of foundation. Place over this a queen, excluding honey board and super of section boxes. Next take the combs from the old hive and shake the bees from them down in front of the new one. You can shake the frames quite free of bees, leaving only a few of each frame to care for the larvae. There will be hundreds more hatched out before night. After brushing all the bees out of the old hive replace the frames of brood and set it to one side. Four or five of these hives of hatching brood can be placed on top of each other to retain the warmth should the night be cool.

A few days later queen cells can be taken from the parent hive and those which have swarmed naturally and distributed among the other hives, at this time setting each hive on a stand by itself. I finished a yard of 60 colonies up in just a week by this method and have obtained better results than if I had waited for the whole to swarm naturally.

It sometimes happens that these forced swarms decline to "stay put," especially if they are just on the verge of swarming. Then it will be necessary to give them a frame of partly unsealed brood. These swarms are compelled to take the honey up into the sections where it is wanted.

If you wish to know whether a colony is preparing to swarm by building queen cells, or if you wish to cut out cells from a colony that has swarmed, instead of taking out each frame, set the hive upon end and kneel down in front of it. Most of the cells are on the bottom of the combs. You can drive the bees back with a very little smoke and easily see two-thirds of the way up between the combs. It is very seldom that a queen cell is further up than this. If one is, you can see it by looking down from the top. If you wish to cut out the cell, you can do it in this way with less than one-fourth the work and time required in taking out each frame, and also make a sure job of it, or in handling the frames the bees, unless we brush or shake them off, are in our way, especially on the bottom of the combs, where most of the cells are. This plan also disturbs the bees less. Anyone with a little practice can, in a hive with frames not deeper than the standard and having a narrow bottom bar, tell for a certainty whether there is a queen cell or not without removing a frame. This cannot be done with loose frame, unless they are held by spacing trips.—Coleman's Rural.

THOSE AWFUL QUEENS.

How in the world comes it that scarcely a single one of all those queen cuts printed by queen breeders and bee journals is anyways really representative of the creature? In he cuts the antennae mostly run in a steady curve from beginning to end—in nature, and at rest, they grow out nearly straight for about one-

third of their length where there is a very well defined joint from which the rest, about two-thirds, continues at a more or less pronounced obtuse angle, directed downwards and outwards. And then the head—in the pictures it looks like a cork protruding about half way out of a beer bottle. It's the legs, though, that take the prize. Out in the canyon there is a spider, blue-black and ugly, well, it's her legs the engraver has engraved onto the queen, except for those sailor hooks at their ends, they seem to be the creation of his own genius exclusively. And a torpedo boat appears to have done service as model for her posterior terminus, only—probably to have things in harmony with the rest of the crazy scheme, the stern of the one is fashioned after the bow of the other, and the bow after the stern. Indeed, from a distance the thing might be imagined to represent a rowboat in active operation, with its oars and steering gear "pulling for the shore."—Henry E. Horn.

"STOMACH-MOUTH" OF THE BEE.

Schoenfeld made the discovery that there existed a peculiar organ in the honey-bee between the honey-sac and the true stomach called "stomach-mouth," a four-lipped opening or rather valve with a protruding neck which may be shoved forward through the honey-stomach and brought into connection with the esophagus or swallowing pipe. Thus nourishment may be taken in or passed out without emptying into the honey-stomach at all. It was supposed that the bee could pass the honey from the honey-stomach to the chylus—or true stomach through the "stomach-mouth," and many hold to that opinion now. Dr. Miller says in his comments in the ABC of Bee Culture, that the bee can do this and live a long time on the honey stored in the honey-stomach. This, however, is contradicted by many close observers of late. One writer says if the honey bee was enabled to live on the honey in her own honey-stomach she would in all probability not lay up any honey at all, but she must empty her honey-sac first before she can take food into the true stomach, thus she is compelled to hurry home and store the gathered nectar into the waxen cells. It is, therefore, probable that raw nectar is not taken into the true stomach neither for food nor for any other reason. The chemical change that occurs, when the nectar is transformed into honey, is probably the work of certain glands located along in the mouth and the honey is not used for food by the bee until it is thus transformed.

The lips of the "stomach-mouth" are fringed with hair pointing inward. It is said this hair acts as a strainer to catch and separate the pollen from the honey. But the gleaner of this cannot see how the pollen can be strained out of the nectar by this apparatus for, according to the above representation, this nectar does not pass through it at all without it went into the true stomach.—American Beekeeper.

The honey of Southern California will aggregate about 60 carloads this year. The price to producers will run between five and six cents for extracted as a rule.

The lowering water of the Colorado necessitates care on the part of ranchers in Imperial in the matter of irrigation.

PUMP IRRIGATION

AN I.H.C. ENGINE
WILL GIVE YOU ALL
THE HEAD YOU CAN
TAKE CARE OF

IF you have to depend upon the pump for irrigating your land, you must have a powerful engine.

Formerly irrigation on a large scale by pumping was thought to be impracticable. But that was before the days of the I. H. C. engines.

In building engines for irrigation purposes it is necessary for the designers to take into account the fact that water must be raised in quantities, and that frequently it must be raised to a considerable height.

The use of hundreds of I. H. C. engines by practical irrigators is evidence of how well these requirements have been met, and how well the I. H. C. engines are adapted for this special work.

The engines are not only powerful, but they have the two other absolutely necessary requirements:

They do your pumping economically.

They run dependably with practically no attention.

Irrigators of large tracts of land must have an engine that is economical in fuel consumption. The I. H. C. engines have reduced fuel consumption to a very low minimum.

It isn't necessary to keep an extra man to attend to the engine. Only an occasional return to the engine is necessary, or a small boy can give it all the attention required.

If you have a lake or stream below your land, or ditch, just look into the matter and see how well an I. H. C. engine will solve your irrigating problem.

Vertical engines made in 2 and 3-Horse Power.

Horizontal (portable and stationary), in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Deciduous Fruit Culture

ZANTE CURRANTS.

THE dried currant of commerce is not the dried fruit of currants as is frequently supposed, but is the product of a grape vine. Since the Thompson seedless has been so extensively planted in California, the market has taken large quantities of the dried product and the Thompson seedless makes a better quality of goods than much of the foreign material that is imported. The true Zante currant is grown in various parts of California, but not so extensively as the Sultana and Thompson. The latter is the most prolific of the three and makes the best looking dried fruit. The berries are larger and of an amber color.

The imported currants come principally from Greece and often the crop is damaged by rains during the curing season. This helps the California seedless grape growers during such seasons, but perhaps more benefit is derived by the California product getting a hold on the market. The product that is imported comes in barrels and with it sometimes a large amount of dirt. Even after such currants are washed they are unfit for use. This grade is of course, not the best or perhaps even the average, but it finds sale and the California product should and will in time take its place.

The true Zante currant is quite

widely grown in California and in some sections is very prolific. There are two varieties of this fruit, the white and black. The latter always bears a seedless grape of small size and can be relied on in this respect, but the black variety will often produce berries of large size and full of seeds. Often half of the berries on a bunch will be over size and full of seeds. It is worthless as a currant or for any other purpose.

While Thompson seedless is being placed before the consumer, as a substitute for the Zante, there is considerable difference in the flavor of the two. The Zante contains more acid than either Thompson seedless or seedless Sultana, which gives the peculiar tart flavor to cookery.

The California dried currant supply has heretofore come from the northern part of the State, but the desert regions have shown results that seem to forecast a strong competition with some advantage over the northern sections, in the matter of curing the crop.

NUTS.

The almond crop in various parts of the State bids fair to be heavy. No late frosts or unfavorable spring weather has interfered with the setting and trees which are seldom with a crop, are full this season. This is especially true in Southern California.

All nuts bring good prices every season and there is no reason why many irrigated farms growing alfalfa and various crops requiring irrigation, should not work in many nut trees along fence lines and irrigation ditches. We know of almond trees growing in the Sacramento Valley, that produce as large an income per acre as the alfalfa does. The trees provide shade for the stock during the hot summer and the nuts were gathered from the trees by knocking them off onto sheets in the usual manner without turning the stock out during the harvest season. We one time helped harvest a crop of almonds under these identical conditions. The almonds netted the farmer \$100 per acre that season and at the same time the land was used for alfalfa and stock. This is not usual, but it helps to keep the pot boiling. The trees were trimmed high so that the nuts could not be reached by the stock. We do not advocate handling orchards in this manner, but there seems to be no reason why pasture lands cannot be so handled with advantage to the grower. Stock should have shade and trees planted for shade can be made to more than pay their way.

When blighted portions are cut from twigs of trees they should be at once burned. The dead wood really contains no live blight spores, but the point where the living tree comes in contact with the dead part may.

FRUIT DRYING.

I have failed to see anything in the Cultivator about drying fruit. I am going to tell about my experience last fall and I have dried fruit for years, yet this was a lesson to me.

I risked putting in the bin a good many apples not thoroughly dried, thinking the ones that rattled would absorb the moisture from the wet ones. I found out that it is not a good plan when there are several tons in the bin. I believe it is good to have them so that they can be stirred occasionally. I did not leave room for this and was sorry for it afterwards.

I kept piling them up in a bin until I got ready to pack them, and the consequence was, when I got down to the middle I found my apples pretty soft, and some had moulded. Now, to look at the top of the bin they were the finest lot of apples I ever saw.

Do most people make a practice of stirring up their fruit, when it is in the bin and do people fumigate their apple houses to kill the worms?

I have heard people say they could not understand why their fruit became wormy so quick. I understand. It is because the old bins are full of worms all the time. If we tear one to pieces we will find them. They should be destroyed before new fruit is stored.—C. J. C., Sebastopol, Sonoma Co.

Record of Mrs. Vrooman's Franquette Walnut Grove Since It Began Bearing:

OREGON NURSERY COMPANY, SALEM, OREGON:

Gentlemen:

You ask me to give you a report of the increase of my Franquette walnut trees since they began to bear. Happily I have the figures at hand:

When 3 years old, 1901.....	82 lbs.
When 4 years old, 1902.....	520 lbs.
When 5 years old, 1903.....	3,700 lbs.
When 6 years old, 1904.....	6,000 lbs.
When 7 years old, 1905.....	12,325 lbs.
When 8 years old, 1906.....	24,314 lbs.

The output has practically doubled every year since the trees came into bearing.

(Signed) MRS. E. M. VROOMAN.

Walnutmere, Santa Rosa, Cal., Nov. 22, 1906.

This 55-acre grove is planted with 1000 First Generation Franquette trees grafted in a direct line from the original Franquette tree in France and is the only large, grafted bearing walnut grove in the world from which seed stock and scions for grafting purposes can be secured.

We have contracted for the entire output of both nuts and scions for three years, which gives us absolute control of the product of this, the world's greatest, grafted walnut grove.

Last year, 1906, eight years from planting, we paid Mrs. Vrooman, \$6,140.-55 for the crop of nuts; over \$100 per acre.

Write for FREE BOOKLET giving full information of the LARGEST stock of FIRST GENERATION GRAFTED and SECOND GENERATION walnut trees in the world.

REPORT ON PLANT DISEASES.

The Experiment Station Record refers to a valuable report made by Ralph E. Smith of work during 1906, the principal investigations having been made on pear blight, walnut blight, peach blight or shot-hole fungus, tomato diseases, and asparagus rust. In addition, investigations have been begun on rose diseases and citrus fruit diseases.

The pear blight work is largely in operation with the Bureau of Plant Industry of this Department, and consists in the application of the methods commended by that Bureau. A detailed account of the investigations in the different counties is given. It has been found that thorough winter pruning prevents blossom infection in the spring, and that the larger the district covered in the winter the less will be the infection the following season. Frequent and prompt summer cutting is to be practiced, and if not exposed to extremely abundant infection, a pear orchard can be profitably maintained in good condition. The walnut blight investigation has been a continuation of studies on the bacterial disease of walnuts due to *Pseudomonas juglandis*. Thus far the disease has proved difficult to control, as spraying experiments have not been very successful. The size of the trees made spraying almost prohibitive, on account of the difficulty and expense.

The beet blight described appears to be due to a derangement in the normal functions of the plant, and investigations seem to show that by attention to planting and cultivation in connection with weather conditions the disease may be largely controlled. The peach blight or shot-hole fungus reported upon is due to a species of *Coryneum*, and spraying with Bordeaux mixture proved quite efficient in controlling it. In addition to the peach, the almond is subject to this disease, and probably the fungus will be found to attack other stone fruits. The other investigations are briefly described, and the bulletin concludes with a list of the more common plant diseases that have been observed throughout the State, with notes as to their relative importance.

HOME-GROWN TEA.

The United States Department of Agriculture will shortly issue a Farmers Bulletin (301) entitled Home-Grown Tea, prepared by George F. Mitchell, Scientific Assistant, Bureau of Plant Industry.

The bulletin describes briefly the methods of growing tea plants and the handling of the same for the production of tea. A practical method is described for the making of tea from the fine leaf, using only such pieces of apparatus as are found in every kitchen.

The bulletin will be of particular interest to persons throughout the South who may desire to grow tea for home consumption. It is illustrated by four text figures.

Copies may be obtained by application to the Secretary of Agriculture, or to Senators, Representatives, and Delegates in Congress.

APPLE SHIPPERS.

The thirteenth annual meeting of the International Apple Shippers' Association will be held at the St. Charles Hotel, Atlantic City, N. J., Wednesday, August 7th, 1907, for the election of officers for the ensuing year, and the transactions of any business properly coming before the meeting. There will be interesting addresses pertain-

ing to apple-growing, packing and marketing, committee reports, and discussions.

D. O. Wiley of Detroit, Mich., is President and A. Warren Patch of Boston is Secretary.

Now is the time to watch the yellowish white grub about one inch long which bores beneath the bark at the lower part of the trunk of the peach tree and about the roots. These grubs are larvae of winged insects, looking something like small wasps. If you see gummy material at the surface of the ground about the trunks of your peach trees, assume that the grub is working there. From June 1 to August is the season during which the grub is most active. Peach growers have learned to protect peach trees by removing the soil at the base of the peach tree, then winding stout paper about the lower part of the trunk as close to the roots as possible, thus keeping away the insects which lay the eggs which produce the grubs. But first the grubs must be removed that are already at work. Others place wire screens about the base of the peach tree.

The water-holding capacity of a soil depends largely upon its physical texture and is also influenced to some extent by the amount of organic matter present. For instance, a heavy clay soil containing a large amount of humus might hold thirty per cent of water and still be in workable condition, while sandy soil having ten per cent of water might seem very wet. It is, therefore, obvious that when success in dry farming depends upon the storage in the soil within the reach of plants of enough water to carry a crop to maturity, the water-holding capacity of the soil becomes a matter of the first importance.

Potash

is the Gateway to Big Grain Crops

Grain can't grow without food. It must get it from the soil. It is for the farmer to see that his soil has enough of the right kind of plant-food necessary to the kind of crops he grows.

The fertilizer for Wheat, Rye and Barley should contain at least 6% Potash. Rather than risk an under-supply, mix Muriate or Sulphate of Potash liberally with the fertilizer before applying.

Send for our free books on growing grain. They won't give you theories, but facts on how the right use of Potash has turned poor soil into good soil, and made good soil better soil.

BEAUTY EVERYWHERE.

There is beauty in the woodland,
When the leaves are fair and green,
And the overarching branches
Make bright fairy bowers between;
Where the birds find place for nesting,
Where they trill their merry lays,
Making music, O, so charming!
Through the halcyon summer days.

There is beauty in the valley,
There is beauty on the hill,
In the orchard, field and garden—
Beauty, look where'er you will;
On the land and on the water,
In the soft blue sky above—
"O, the world is full of beauty
When the heart is full of love!"
—Selected.

THE GIRL WHO LAUGHED.

A GIRL was gathering roses in the yard as Morris Greene went by to his work. He was a carpenter and joiner, working in Mr. Mills' employ, and this girl who was gathering roses was Mr. Mills' daughter, Fleece. They called her Fleece because her hair was so fine and thick and blond and curling when she was a child—like a little lamb's wool. It was put now in a graceful knot at the back of her head, but was still all of a fleece over her brow and about the shell-like ears.

"Good morning," said Morris, looking at her with admiring eyes.

"Good morning—here's a rose for you," she answered and laughed.

That laugh! She was always laughing—giggling, the spiteful girls said. Just a little bubble and ripple of a sound, that she closed every remark with, whether grave or gay. It was a sweet, musical sound, and yet it always made Morris uncomfortable. He felt as if she were laughing at him. He was glad enough of the rose—she threw it at him over the yard fence, and he caught it dexterously in his left hand and almost involuntarily lifted it to his lips.

Then Fleece laughed again and ran up the path.

Morris walked on with the rose in his hand and love in his heart. Oh, yes, he did love her, but what was the use of it? If he told her she would laugh at him. She was not deep enough to understand a love like his—she was nothing but a pretty, shallow laughing creature, as full of fun and frolic as a kitten.

But he kept the rose all day long in the pocket of his coat. When the sun grew too warm and he threw the coat aside on a pile of lumber, he remembered to take out the rose and put it in his blouse. There his mother found it that night when she took the blouse to sew up a rent in the sleeve.

"What old flower is this?" she asked. "Shall I throw it in the wood box?"

Morris was lying stretched upon a lounge, reading a morning paper. Handsome enough he looked to please any girl's fancy in his bright dressing gown and slippers, one arm under his dark, fine head, the other holding the paper in an easy, graceful way. But the paper dropped and the dark cheek flushed hotly at this sudden question his mother had put.

"No," he said, "give it to me. I—I want to keep it mother."

The mother handed him the flower, and stitched away in silence for a moment. Then she said:

"Is it the love token of some girl, Morris? I think you might tell your mother if it is. I am getting old and weary, my boy, and very willing to resign my duties into younger hands.

We have a cozy home here, and a good enough one for any girl. If you bring a good wife home, Morris, no one will give her a heartier welcome than your mother."

"It was no love token, mother," Morris said gravely. "Only a rose that Fleece Mills tossed me as I passed by this morning."

"Fleece Mills is a vain, pretty giggling girl, Morris," said the mother, not lifting her eyes from the lamplight. "She has never known a care or sorrow and looks upon life as a good joke, and nothing more. She is not like our neighbor's daughter, Jane Smith."

"Not at all like her," answered Morris, quietly, with his hand shading his eyes from the lamplight. "Jane always looks on the serious side of things, and I never saw her more than smile, and she always seems sorry for having done that."

"Jane is a good girl," said Mrs. Gurnee, quickly, "and a very conscientious girl. Modest, earnest, proper in behavior and viewing life in its true sense. She would not be pelting young men with roses. Yet she cares more for you, Morris, than Fleece Mills does, or even can; and Jane is a pretty girl, Morris—pretty enough to please any man's taste."

"Yes, I think she is pretty," answered Morris, as if he had just thought of it for the first time, which was true.

"And she would make a good wife, Morris."

But Morris had no answer to this. He arose, presently, and went to his room and lay there thinking, thinking. His mother was growing old, he was receiving a good salary, his home was paid for and he was twenty-six years old. It would be better all around if he should bring home a wife.

Jane Smith was a pretty and a good girl, and he believed she cared for him, or would grow to if he asked her. She was too prudent, too sedate, too regardful of the "proprieties," to allow herself to care for a man until asked. His mother liked her; why not end the matter by asking Jane to be his wife? But Fleece—oh, Fleece! laughing Fleece, Fleece, Fleece! and saying the name over softly again and again, he fell asleep and dreamed he stood before the altar, plighting his vows to Jane Smith; and just as he was about to utter "I will," which would bind him forever to her, Fleece Mills pelted him in the mouth with a blood-red rose, and then she stood and laughed at his silent confusion.

He overtook Jane Smith the next morning as he was going to his work, and walked a few squares with her. She was pretty, with such soft, black hair and dusky eyes, and she actually smiled at him once. They passed Mr. Mills', and Fleece was watering a hanging basket in the open window, and looked and said "Good morning," and then laughed.

"What a giggling girl Fleece Mills is!" said Jane, gravely. "She seems to think life was made for laughter. I wonder if she ever had a serious thought?"

But their ways separated here, and Morris was spared a reply. Ah, well, Jane was right—his mother was right—Fleece was a light, vain girl, a human butterfly, and he was a fool to think of her. He would think of her no more.

He saw a good deal of Jane Smith for a few weeks after that, and quite made up his mind to please his mother and ask Jane to be his wife when an accident occurred. He fell from a scaffolding and was carried home a helpless mass of broken bones and bruises. His mother fainted, the sight of her son borne by strong men.

Neighbors crowded in to render assistance. Jane Smith came to the door.

"Is that you, Jane?" she called. "Oh, come in. They tell me he is dead, only hurt and bruised. I am glad you have come to be with me. But Jane shook her head.

"You have plenty to help you, see," she said, and if I stay people will talk. They will say I was bold to thrust myself in the way when was not needed. I must not forget my dignity or sex you know. I will come every few hours and inquire how he is, and if you need help, send for me. I shall pray for his recovery dear Mrs. Gurnee."

She was turning to go, when someone rushed past her into the room.

It was Fleece Mills, all wrapped in a white shawl, her face white, blue eyes dilated. She looked like a vision. Unmindful of the presence of any third party she sprang to the side of Mrs. Gurnee, and put her arm about her, the tears flowing down her cheeks.

"Oh, she cried, "I am so sorry for you—so sorry. Tell me, is he dead? Will he die? I have heard such cruel tales, a dozen different ones, on my way here."

"No; he lives; he is terribly injured, but he will get well; they tell me so."

Then Fleece arose, and the gladness came back to her face as she said:

"I am so glad—so glad! Thank Heaven!"

And then she laughed.

Morris surrounded by physicians and attendants in the next room heard the laugh.

"Who is that?" he cried, in a clear strong voice. "Who laughed?"

"It was I—Fleece Mills," she said and went toward the door.

"Come here," he responded, "I want you. I must go through a painful operation; my shoulder is dislocated and my limbs broken in two places. I am internally injured also, and may not live through it all. Come and touch my hand before you go."

"But I am not going, Morris," she said, bending over him. "I came to stay, to comfort your mother, and be with you while you need my care. If you will let me, I will stay here while they are setting your limbs. I will hold your hands, and if you look right in my eyes, I think you can endure it."

"But my dear young lady," interposed the head physician, "it will try your strong nerves. We have forbidden his mother the room and if you faint or scream, it will unnerve the patient and prove fatal."

"I shall not faint or scream," she said quietly.

"But," persisted the physician, "you do not know the ordeal. We do not administer chloroform because of his internal troubles, and he must show such agony that you cannot endure it."

"He needs me, and I shall remain," she said. "You need not fear for me."

"God bless you," whispered Morris and clung to her hands.

It was a terrible hour, but Fleece

Mills did not wince or waver. She stood at her post, white as death, but smiling bravely, and touching the sufferer's brow with tender, cool hands, and speaking to him in low, soothing tones when the pain grew most intense. And he never once took his eyes from her face.

"You have been very courageous, and have helped us to perform a most dangerous operation," said the physician, when the last bandage was adjusted, the last bruise bathed. "The young man will live. The only fear was that he had not vitality enough to carry him through the operation. Now that he has endured it so well, he will recover."

And again Fleece laughed—a ripple that filled all the room and brought a smile to the white face of the sufferer.

"God bless that laugh!" he said, feebly. "Now go and rest, Fleece."

And as soon as Fleece was outside the door she fainted dead away. Only a swoon, however, which she recovered from readily, and was soon at her post again.

"How heartless of that girl to laugh in the house of suffering," said Jane Smith. "How bold of her to thrust herself upon them in such a way. I wonder what Mrs. Gurnee thinks of her. I know Morris must be disgusted."

But Morris' conversation with his fair nurse a few days later did not savor of disgust.

"I have loved you so hopelessly for a whole year," he said.

"Why didn't you tell me so," she asked.

"Because I feared you would laugh at me. You are always laughing at me."

Here Fleece rippled into a laugh again.

"There, I knew you would," said Morris; "it is just as I expected."

"But I was not laughing at your love for me," she said, "only at the idea that you would think I would laugh," and she laughed more than ever and Morris joined her.

"You men are so blind," she added.

"I have loved you two years, and tried to make you see it. At last I threw a blood-red rose in bloom at you, and thought surely you knew that meant love. But only the next day, I saw you passing by with pretty, black-eyed Jane Smith, and I nearly died of jealousy."

"But I did not dream you would love a poor carpenter," he said.

"My father was a poor carpenter," she answered proudly, and then added softly and reverently, "and so was the dear Savior, my Master. Why should I be ashamed to have my—my husband a carpenter?"

And she buried her blushing face in his bosom.

Morris recovered in an incredibly short space of time from his hurts and broken bones, and in a very brief time thereafter the bells rang forth his wedding chimes.

"Of all the girls out of the whole world," said Mrs. Gurnee, "you have chosen the best one for a wife and for a daughter to me."

It is said that Fleece laughed just after the clergyman pronounced them man and wife, but I don't know how true it is. But certain it is that the laugh Morris used to so object to has become the sweetest sound on earth to him.—Ella Wheeler Wilcox, in New York Weekly.

Astronomy is the science of the harmony of infinite expanse.—Lord John Russell.

RECIPES.

Codfish balls.

Always in season are cod fish balls. The shredded and boned fish may first be soaked in cold water for an hour, and then cooked after the following recipe: one cup codfish; one cup diced raw potatoes; one egg (unbeaten); one tablespoon butter. Salt and pepper to taste. Boil potato and fish together in boiling water until potato is soft; drain; mash with a spoon; add egg and seasoning, and drop by tablespoonfuls into hot fat and fry to a delicate brown. Serve with a white sauce. If one has mashed potatoes it can be used instead of the raw potatoes, boiling the codfish a few minutes and draining before adding the potato.

Baked Pears.

Peel as many pears as you wish to serve, leaving on the stem. Make a syrup of two cupfuls of sugar, then place the pears in the syrup to cook until fairly tender, but not soft enough to break; remove the pears to a dish to cool, and boil down the syrup with a lemon sliced thin in it to flavor it. Cook five minutes. Arrange the pears in a dish, with the sliced lemon around the edge, and pour the syrup over. If allowed to cool a little, it can be served in a glass.

Baked Onions.

Boil the onions until tender in plenty of salted water. Pour off and arrange them in a buttered baking dish. Season with paprika or white pepper and put a good dot of butter in the center of each onion. Pour over a cream sauce, dust with cracker crumbs and bake until browned.

Creamed Eggplant.

Pare the egg fruit and cut in inch dice. Boil until tender, then drain, season with salt and pepper and cover with rich milk. Let this simmer until somewhat thickened, and dish with the addition of a generous lump of sweet butter.

Mock Oysters.

Green corn may be served in a variety of forms, and is delicious to most tastes in all. It is also exceedingly nutritious and fattening, so that its food value is as great as its popularity. Mock oysters or fritters is one attractive variation, and these may be made of other materials also. For corn fritters or "oysters," it is best to split the kernels on the cob with a sharp knife lengthwise, and press them out with the back of the knife. To each cupful of this milky corn add a cupful of sweet milk, a beaten egg and flour to make a batter. Fry in deep fat or saute in a frying pan. Sifted squash combined in equal quantities with the corn makes a good variation. Carrots, cooked very thoroughly, then mashed and sifted, make still another supply. Add a raw egg to each cupful, mold with the hand into small cakes, dip in beaten egg, then in bread crumbs and fry in deep fat.

Orange Custard.

Peel from four to six oranges and halve them, taking out the white part in the center; cut into very thin slices, taking care that no seeds are retained. Place in a glass dish in layers, covering each layer with pulverized sugar. Over the whole pour a cold boiled custard and set in the ice-box until ready for use. This makes one of the most delicious dessert dishes and is very easily prepared.

A True Plane

When you buy an ordinary plane you have to find out by actual use whether it is true or not.

You know a Keen Kutter Plane, or any Keen Kutter tool, is true before you buy it, because it is stamped with the trademark which guarantees it.

You know it will be perfect in hang, balance, temper, finish and adjustment, because all Keen Kutter Tools are tested and inspected and found worthy to uphold their well-earned reputation as Tools of Service, before the name and trademark are stamped upon them. This mark is your safeguard in buying tools. It costs you nothing, but means if anything goes wrong you shall not be the loser. To be sure of lasting, accurate, and practical tools, ask for

KEEN KUTTER

Tools and Cutlery

The name Keen Kutter covers Saws, Chisels, Bits, Drills, Gimlets, Awls, Planes, Hammers, Hatchets, Axes, Drawing-knives, Screw-drivers, Files, Pliers, Glass cutters, Ice-picks, and a full line of Farm and Garden Tools—Forks, Hoes, Scythes, Trowels, Manure-hooks, Lawn-mowers, Grass-shears, Rakes, etc. Also a full line of Scissors and Shears, Pocket-knives and Table Cutlery.

Keen Kutter Tools have been sold for nearly 40 years under this mark and motto:

FOR SALE—25-H. P. FAIRBANKS-MORSE distillate engine as good as new at a snap. **N. W. COR. MAIN AND BRUNO STS., Los Angeles.**

Fruit growers throughout the San Joaquin valley are pleased with the new refrigerator express service between San Francisco and Los Angeles.

The citrus growers of Tulare county are aroused on the White Fly question and are urging every step for its control.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Sept. 18, 1907.

Butter.

Butter has declined perceptibly, but prediction is made that 2½-cent advance be made during this week.

Creamery extra per roll...62½
Creamery first...60
Dairy...50
Cooking...45@47
Eastern...55@57½

Cheese.

Cal. Young America, per lb...19
Hand...20
California Anchor...18
Northern fresh...17@17½
Eastern...17½@18
Imported Swiss...32
Tulare flats...17½
Domestic Swiss...21@22

Eggs and Poultry.

The egg market is stronger and selling closer to full quotations than last week. Receipts of local ranch are light but Easterners are heavy. Dealers are apparently boosting the market.

Eggs local candled...35
Eggs case count...32
Fresh Eastern...28
Eastern storage...25

The following are average prices which dealers pay to producers for live weight.

Hens per lb...14
Young roosters per lb...14
Fryers...15
Broilers per lb...17
Old Roosters...8
Turkeys...17@18
Geese...12
Ducks...12
Squabs per doz...1.75@2.00

Live Stock.

The following quotations are f. o. b., Los Angeles, on all stock.

Hogs from 175 to 200 lbs...7½@7¾
Prime steers...4½@4¾
Heifers...3¾@4
Calves per lb...4
Sheep, ewes, per head...4.75@5.25
Lambs per head...4.50
Wethers...5.50

Potatoes.

There is a slight easing of the potato market with quotations seldom reached and a prediction of further decline.

Highlands...1.85@2.00
Early Rose...2.00
White...1.90@2.00
Local Burbanks...1.85@2.00
Salinas...2.25
Sweet potatoes per lb...2¼@2½

Onions.

Oil cake meal...2.50
Rolled Barley...1.40
Rolled barley per ton...25.00
Feed meal...1.70
Kaffir Corn...1.65

It seems just a trifle inconsistent all around that the French vine growers were provoked into civil war because they could not sell their grapes, and that California growers can afford to dry their wine grapes and ship them to France than to sell them to home wine makers. There must be something radically wrong with the wine makers in one country or the other.—Sacramento Union.

H. A. Wheeler, of the firm of Perham & Wheeler, the well-known Black Minorca breeders at Lordsburg, has taken over the interest of Mr. Perham and will conduct the business in his own name from now on. Mr. Wheeler has been the member of the firm that has entire charge of the mating, feeding and breeding of the birds, as well as attending to all correspondence, filling orders, etc., and the change in the firm is a change in name only. Mr. Wheeler will devote his entire time to his big flock of breeders from now on and is in position to supply any demand for stock or eggs to the Black Minorcas fanciers of the West.

San Francisco Markets

SAN FRANCISCO, Sept. 17, 1907.

Butter.

There has been an increase in quotations on butter though slow sales at the increased price. It is predicted a firmer condition will prevail.

California extras per lb...13

Eggs and Poultry.

Fresh eggs of the first quality are at a premium and storage stock meets with a continual call with quotations fluctuating daily.

Fresh ranch eggs...39½
Eggs firsts per doz...3
Eggs seconds per doz...2
Eggs thirds...2
Eastern selected...24½
Eastern firsts...2

Two more cars of Eastern poultry arrived yesterday to swell the receipt of the previous carry-over. Local stock, because of the present poor trade conditions, is coming in slowly. Dealers report a generally weak market. Buyers refuse to take stock even at ruling moderate figures and dealers are making liberal concessions daily to prevent too much accumulation.

Hens per doz...4.50@5.50
Hens large...6.00@6.50
Young roosters...6.50@7.50
Old roosters...4.50@5.00
Fryers per doz...5.00@6.00

Hogs 200 to 300 lbs...7½
Calves per lb...4½@5
Lambs, yearlings...6@6½
Wethers, No. 1...5½
Ewes, No. 1...5

Potatoes

Sweet potatoes were in general, of medium quality but moved along freely. Quotations on Salinas Whites declined somewhat, but there was no special inquiry made for them.

River Whites...1.10@1.15
Salinas...1.50@1.8
Early Rose...1.00@1.2
Sweets...2@2½

Vegetables.

The vegetable market was quite active yesterday. Receipts were moderate and limited enough to hold the market firm. Quotations fluctuated but little and all supplies were well in control all the morning. Quite a quantity of Saturday's carry-over was disposed of at the ruling figures of the day. The tomato market brightened up materially and the stock is now ripe enough to figure as choice grade. Cannerymen dealt considerably in the yesterday. Some Red peppers arrived but the market for them and the great variety is quiet.

Asparagus...50
Cucumbers per box...50@1
Corn per sack...1.50@2
Chili peppers per box...35@40
Bell peppers per box...50@75
Egg plant per box...25@1
Green peas per lb...20

Citrus Market

LOS ANGELES, Sept. 17.—Valencias are so nearly cleaned up that there can be said to be but little interest in range markets. Another week or two will see practically all shipped, though an occasional car may be held over into October. The principal interest now is as to boxes and appliances for next year's output. Packing-houses are being overhauled, graders, brushers, scales, bins and all other features put in condition for economical handling of the coming crop.

While some still maintain the crop will be lighter than this year it is probable now that an increased output will be given if fair weather conditions prevail from this time.

Valencias are usually commanding \$3.50 and \$3.75, f.o.b. California, but some auction sales are much below that.

Lemons are scarce and commanding good prices. Foreigns are not coming freely as earlier in the season.

Citrus Shipments.
Shipments of citrus fruits this year 7,142 cars, of which 3275 were lemons. To same date last year, 25,440, of which 516 were lemons.

NEW YORK, Sept. 16.—The orange market is much stronger and here is a good demand for grapefruit, 18s to 80s; dull on 96s and smaller. Weather hot.

REPORT OF STATE BOARD OF TRADE.

The seventeenth annual report of the California State Board of Trade is at hand.

It covers both the years 1905 and 1906, and while mainly devoted to the resources, industries and development of the country, it gives some space to other features that make the Golden State pre-eminent as a land of attractiveness to every one, whether bent on business or pleasure.

Making and breaking dams in the head ditch and making and closing breaks in its bank are not in keeping with the best irrigation practice. In permanently laidout fields the ditches should be provided with boxes or with back flows for the control of the water. When water is first turned onto the land the flow from the first box should be so regulated by raising or lowering the gate that the flow will fill the desired furrows, and so on down the lateral until the water is all in use.

CALIFORNIA STATE FAIR.

Continued from First Page

In machinery and farm appliance class the greatest interest was attracted by the milking machines, of which there were two, a foot-power and a power machine. From four to five o'clock every afternoon big crowds surrounded these machines and witnessed the demonstration of their usefulness.

The greatest lack noticed at the fair this year was that of farmers to attend it. The attendance at the pavilion, especially in the evenings, was all that could be asked, and has given good financial returns to the management. The attendance at the races in the afternoon, especially on Governor's day, which was made more of a social function, was very good, and the grand stand was at times fairly well filled. But the California farmer around the stock pens or examining newer makes and latest patterns of machinery were conspicuous by their absence. To one who has been used to seeing the Eastern State and county fair grounds with the big grove at one end filled with thousands of teams tied to the rear end of the wagon while farmers who drove in from the surrounding country spent the entire day in picnicing and taking in the sights and side shows of the fair, the Sacramento attendance was most disappointing. There are no "woods" or groves whatever upon the grounds where a farmer can drive his horse under the shade. Even the trees which were planted as a border to some of the drives never seemed to get encouragement enough to live and start their first leaves. The management needs to get some one who understands tree planting to get some trees to growing to give some shade.

Possibly there is too little of the farming community about Sacramento to who would drive in and get the advantage of the fair, but if such is the case, there should be a change in its location, for sure it is there was not during the entire week a single vehicle driven into the grounds which looked like a farmer's outfit coming in to enjoy the fair. Quite often an automobile, or occasionally a coupe, or sweet rig of some kind from the city drove in to enjoy the afternoon racing.

This cannot be said to be the fault of the management of the fair for sure it is that an instructive exhibit was gotten together this year which was worthy of more general attendance on the agricultural grounds. This, doubtless, because of the odor of the racetrack days. If this can be wiped out of the minds of the producing class, and the knowledge gained that a genuine agricultural fair is in progress at Sacramento, California may yet rise to the dignity of having an exhibition that will be instructive as well as profitable to the management.—C. B. Messenger.

The September number of Forestry and Irrigation, the monthly magazine of the American Forestry Association, contains a number of articles of unusual interest. Among its leading features are: The Norway Poplar, or Sudden Sawlog; The Debris from Hydraulic Mining in California; A Domesday Book for Oregon Waters; A National Need; Effect of a Late Spring Frost in the Southwest; Forest Planting in Connecticut, 1907. It is handsomely illustrated and is well worth reading.

Durable Harness

Your harness will always look well and wear well, and will give double service if treated with

EUREKA Harness Oil

Prevents rotting. Gives a glossy black finish. Makes leather soft, strong and durable.

BOSTON COACH AXLE OIL

is the best axle lubricant. Will not gum or corrode. Superior to castor oil and more economical. Sold everywhere—all sizes.

Made by STANDARD OIL CO. Incorporated

READING COURSES FOR HOME STUDY.

Excellent reading courses for home study are now provided by the Extension Department of the University College of Agriculture. Two such courses are offered at the present time: One in Economic Entomology and the other in Irrigation Practice and Institutions. These courses may be looked upon as an outward growth of the Farmers' Institutes and are designed to amplify and broaden the work of such meetings. Enrollment is hedged about by no difficulties. Anyone desiring to read up on the subjects offered, in a systematic way, may enroll and literature will be furnished free of cost save transportation from and to Berkeley. The books and publications are chosen as representative of the best thought and study and experience on the questions at issue. Students using them have the privilege of consulting on difficult points members of the staff of the College of Agriculture at Berkeley who are specialists in the various lines. University Extension teaching will thus be brought directly to the students' homes. During the year just ended 165 students have enrolled in these courses. Thirty-seven counties of this State and four States beside California are represented. An analysis of the enrollment shows that 95 per cent of the students are directly interested in some form of Agricultural work—in other words, those to whom the courses are most profitable are registered.

LITTLE USE FOR WHIPS.

A dealer in whips says there is a great change as to the number of whips that are now sold to drivers. "Why, in proportion to the number of people," said he, "I think not half so many are used as were used, say, twenty-five years ago. Many owners of horses never carry a whip. I know men in this country who always have horses and who never strike them. Many people hold that if a horse is properly reared from colthood up it will never need a whip. What are called the bad traits of a horse are usually the fault of the people who have handled them. Some bad traits are hereditary, but they trace back to bad management of the ancestry. The more good sense a man has the less punishment his team will need. It is practically all a matter of good common sense."

Placer county is turning out a big hay crop this year, of an average quality, but grain yield is light owing to the unfavorable climatic conditions last winter.

Orchard Scenes in Southern Oregon

No State Raises Better Fruit.

Courtesy Pacific Northwest

SINCE Southern Oregon won its laurels at the Irrigation Congress, the question is asked: "Can Oregon really raise fruit?"

We Californians may question it if we will, but before another contest of importance occurs, let us awake to the fact that our neighbors to the north are some on fruits and if we would win we must make our best showing of finest fruit.

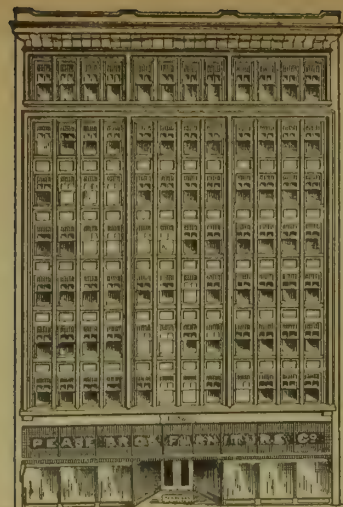

Here is the way they talk of themselves up there:

"Here the expression, 'My own vine and fig tree,' is not figurative. The farmer may and often does have both. Peaches, apricots, almonds, grapes of all kinds, apples, 'just as good' as the famous Hood River or Willamette Valley pomes, pears that are sold for

\$6 a box in New York and still higher in London, and other fruits in bewildering variety are grown here.

"But while fruit will ultimately make this section of Oregon as famous as it has made certain parts of California no more favored by nature, there are in these Southern Oregon valleys hundreds of thousands of acres of good general farming land which can be had at low prices.

"These southern valleys are destined to become famous in course of time for their wines. In fact, good wines are now being produced even in the Willamette Valley, where natural conditions are not so favorable as in the southern valleys."

The Jersey as an Economic Dairy Cow

A Friend of the Jersey Tells of Some of Her Good Qualities and Gives a Bit of Her History.

FROM a paper prepared by Mr. Claud D. Tribble of the Enterprise Jersey Farm, Elk Grove, for the session of the California Live Stock Breeders' Association, we make the following quotation:

One of the striking characteristics of our modern economic progress has been specialization—devising of ways and means best suited to obtain specific results. The breeding of cattle was one of the first industries to feel the effect of this tendency, and the various specialized breeds of cattle are the results, developed from races of cattle that originally were but differently fitted for any particular purpose, and which utilized for different purposes, for milk, for butter, for plowing or other different purposes as the occasion required.

The demand for superior beef cattle led to the selection and development of the Short-horn breed, and the Holstein and Ayrshire cattle are the results of efforts directed to attain a large milk flow. But these breeds left the important qualities of the cattle race largely unfilled, and progressive breeders sought a cow that would give a product of great richness, combined with a persistent milk flow, gentleness of disposition and beauty of conformation. In search of such an animal the attention of the breeders of England and America was early turned to the cattle of the Channel Islands, and eventually concentrated on one of them.

in.

This favorite breed of cattle originated on the island of Jersey, which is situated off the N. W. coast of France but is an English possession, being a part of the Dukedom of Normandy, which William the Conqueror governed when he seized the English throne in 1066, since which time the island has belonged to England.

The breed is a living example of what consistent effort along a given line will do, for the Island of Jersey enjoys an international reputation because of the famous breed of cattle developed there through the persistent efforts of a population whose chief concern is that of animal husbandry. Nature did much for the Island of Jersey in providing it with a delightful climate. The landscapes are said to be picturesque in the extreme and the scarcity of land, things considered, accounts in a measure for the developments of a world famous breed in a country only about eleven miles long and not more than nine or ten miles wide. The total area of the Island of Jersey is less than 40,000 acres, and as a result land is very valuable and holdings are extremely small. A greater portion of the land is owned by the farmers, which is different to the most of Europe where most of the land is owned by landlords and tilled by tenants. Every part of the soil is used to its greatest advantage, and a large part of the Jersey cattle raised on the island are raised under picketing or tethering system, which calls for the greatest amount of personal care, and is the reason why this breed has been so wonderfully developed for dairy purposes. Then, the comparative isolation of the island, in that the exchange of livestock with other countries was difficult for many years, coupled with the devotion of the people to their favorite breed enabled the weed-out of undesirable animals and the blending of the various types which at an early date made a harmonious whole, giving us one of the most

perfectly developed and desirable dairy breeds in existence—a breed, in fact, that has achieved national reputation in almost every civilized country where milk and butter are prized the necessities of life.

Purity of Breed Maintained.

It is probable that the Jersey cattle are descended from the cattle of Normandy, which they are said to resemble in some respects, notably in the cropping out of certain well defined color markings characteristic of this breed. History proves, however, that there has been no admixture of foreign blood with the island cattle for more than 500 years, and it is not surprising that in that time careful breeding, abundant food and the most painstaking care imaginable should have developed animals possessing every desirable trait from the standpoint of dairy production. It can be safely said that for more than 100 years there has been no importation of live stock in the island except to provide meat for the inhabitants which is immediately slaughtered, the introduction of other breeds being for

Island of Jersey Herd Book and through their rules of entry seek to induce breeding from the best stock, and in other ways maintain the excellence and stimulate the advancement of the breed. Any island cow obtaining first, second, third or fourth prize or certificate of merit at a department show is eligible to the herd book. When the first calf of a registered stock is presented for entry the dam must also be presented for examination and qualification. Animals so improved by the society are entitled to the rating or "commended" on the herd book, and those of exceptional merit are entitled to "H. C." or highly commended.

The Jerseys have been well and favorably known in the United States for more than half a century. It is known that a cow was brought from the Channel Islands in 1817 which was probably a Jersey.

In America.

The foundation stock of the American Jersey cattle was imported in 1850 by Thomas Motley of Mass., John T. Norton, and John A. Taintor of

A Typical Jersey

Sweepstakes of Dairy Breed, California State Fair, '07. One of the Venadera Herd, Property of Guy H. Miller, French Camp, San Joaquin County.

bidden by law. This law was passed by the legislature in 1789, which prohibited the importation of foreign bred cattle, imposing a heavy fine in money for any breach of this law, as well as forfeiture of the vessel employed, and providing for a fine on each member of a ship's crew who should fail to notify the authorities of any attempt to evade the law. Subsequent laws have been passed equally stringent.

The mildness of the climate in which the Jersey cattle originated account in part for the perfection attained by this breed, for they can be tethered out from May until October, and they are, for most part, only housed at night during the winter. Grass flourishes in their native land, and with hay and roots constitutes a satisfactory ration.

"Commended" or "H. C."

The Royal Agricultural Society publishes the

Conn. About 18 years later they were imported by a gentleman from Montreal, Canada. Since that time there has been almost a continuous importation. They have been a favorite wherever introduced, and it is not surprising that they became distributed all over the United States in a short time; so much so, in fact, that while they are found largely in both hemispheres, the United States is pre-eminently entitled to be called their home. The milk is extremely rich in fat, probably more so than any other breed unless it be the Guernsey, and many of the Jerseys give a marvelous milk flow when their size is considered. The Jersey cow looks the high bred lady of the cattle race, in fact, she rightly carries the name of "Queen of the Dairy."

Weight and Characteristics.

Well developed cows weigh from 750 to 1200

Concluded on Page 307

Deciduous Fruit Culture

A PREDACEOUS INSECT DESTROYING THE WOOLY APHIS.

A MOST striking illustration of the benefit to be derived from an insect parasite preying upon a pest of the orchard is to be found in Western Colorado, in the recent magical riddance of wooly aphids from all upper portions of the apple trees.

Through the past spring and summer and up to the latter part of July great patches of these noxious lice coated with their heavy white woolly secretions, covered the bark and twigs of the trees, while innumerable microscopic new-born young crawled everywhere over bark, leaves and upon the fruit itself.

Good From Spray.

Early in the season many orchardists did much to reduce the numbers of this louse with kerosene emulsion sprays thereby allowing unchecked growth to the tree. At the time these spraying operations were in progress several natural insect parasites of the pest were also gradually increasing in number and assisting in the aphid destruction. A strange but lively warfare was going on, in which the aphids seemed able to withstand the onslaught of their parasites, and were only routed by a charge of kerosene emulsion in the hands of the orchardist.

The Destroyer Comes.

In the Grand Valley during the last days of July and the first days of August, however, a most remarkable reversal of supremacy took place. Within these few days the rapidly increasing numbers of parasites threw the balance of power to their favor, and the wooly aphids disappeared almost at once. So complete was the work of aphid destruction that there is, at this time—a month later—scarcely an orchard in which a single colony of living lice can be found above the ground. Tens of thousands of dollars have been saved the fruit growers by these little benefactors.

Most prominent and by far the most useful of these aphid enemies has been the "Aphis-lion," or young of the insect known as the "Lace-wing fly." The adult lace-wing fly is a very beautiful insect, bright green in color, and an inch and a quarter across its outspread wings. Its wings are very delicate and finely veined. Its eyes are prominent and of bright yellowish-brown color, which sometimes gives to it the name "golden-eyed fly." We have nearly all seen them flying in the orchard in the evening and alighting upon the green foliage of trees infested with some form of plant louse. Many are seen to start from the foliage earlier

in the summer when the arsenical spray strikes the tree, and at that time some orchardists, with but superficial examination, erroneously take them to be the adult codling moth.

Don't Destroy the Eggs.

This summer my attention has repeatedly been called by fruit men to minute thread-like hairs half an inch long standing out from the surface of the leaf or side of the apple, each hair bearing an oval knob. These are the eggs deposited by the green lace-wing flies, and they are found in groups of from thirty to fifty and sometimes ninety eggs, each set upon a stilt, as it were. They are often mistaken for an injurious fungus, and I have known orchard owners assiduously to rub them from the apples and leaves whenever they were found. From these eggs hatch the young aphis-lions, which at once begin feeding upon the aphids. Two or three may completely rid a badly infested apple twig two feet in length. It is in this stage that the insect serves the orchardists as a benefactor. They increase in length to half an inch, appearing as gray spindle-shaped worms equipped with stout jaws and having a tapering body. They are voracious feeders and are somewhat cannibalistic in their nature. I have seen a larva holding fast in its jaws one of the green lace-wing flies—the adult of its

own kind—from which it has sucked the juices of its body.

These larvae, when fully grown, change to pupae within small, spherical, finely woven, white cocoons from which, in time, the frail lace-wing fly emerges. As the fly leaves the cocoon, a circular lid is pushed through the cocoon wall. The cocoons may be found in the orchard through the summer within curled apple leaves, tucked away in the crevices of the bark or in the earth near the tree's base. Coring the fully developed insect from the cocoon from which it issues is a marvel that it could be pushed away within so small a space. The parasite is not an introduced one, but it is native to the country, and plays a most important role in checking other species of lice.

Spray Does not Injure.

It is interesting to note that spraying of orchards infested with wooly aphids with kerosene emulsion does not at the same time materially lessen the number of these parasites. In the case of the wooly aphid, all stages are more or less active. On the other hand, the lace-wing fly, which moves quickly away when the spray strikes the tree, does not ordinarily destroy the pupae or hibernating larvae by fraying through the dense silken

LET US EXPLAIN

to you the difference between the **PURE BRED FRANQUETTE WALNUT**—as shown on the border of this Ad—and the ordinary English walnut. When you buy walnut trees, **BE POSITIVE WHAT YOU ARE GETTING.** Guessing is uncertain and often expensive.

Our walnuts for seed purposes and our scions for grafting purposes are all secured from Mrs. E. M. Vrooman's famous **GRAFTED FRANQUETTE WALNUT** grove of Santa Rosa, California. Her grove contains

ONE THOUSAND TREES---ALL GRAFTED

the only large bearing **FRANQUETTE** grove of "ALL GRAFTED TREES" in the world. Write for our **FREE BOOKLET** describing this "King of Walnut Groves" and its record. When you buy trees that are descendants of this grove you make no mistake. We guarantee our trees to be Pure Franquettes.

We cannot tell you much in this small space, but let us write you direct. The Pacific slope—(generally speaking)—is adapted to Walnut culture and is destined to become the center of this profitable branch of horticulture. Why not start now? Address,

coon, so impervious to liquids in its
construction. The summer arsenical
sprays used so extensively against the
other insects of the apple orchard,
seem to have no destructive effect
upon any form of this insect.

The orchardist may protect this
friend of the fruit tree by refraining
from the application of strong con-
tact sprays at times when the "aphis-
lions" are abundant and when they
promise to predominate over the
woolly aphis. For this season, at
Grand Junction, the latter part of
July and the first part of August was
the period when contact sprays would
have been wisely omitted.

In ridding the tree tops of woolly
aphis, the aphis-lions have been as-
sisted by the larvae of two or more
species of lady beetles, and the lar-
vae of syrphus-flies. Unfortunately,
none of these parasites feed upon the
woolly aphis, which infests the roots
of the trees. These must be reached
this fall by exposing the roots of the
trees and either spraying them judi-
ciously with kerosene emulsion, of
not too high a percentage of oil, or
by treating them with some other in-
secticide of known insecticidal value.
Others to Come.

There has been much good done
throughout the country by the intro-
duction of beneficial foreign insect
parasites, and great benefit may be
derived from our knowing and pro-
tecting those useful insects native to
our locality. Temporary successful
destruction of a pest by another pre-
daceous insect, as in the case report-
ed, however, does not indicate that
thorough spraying by the orchardists
is a futile operation. In the control
of injurious insects the ground gained
by natural enemies should be fol-
lowed up with diligence and persist-
ence by the fruit grower.—E. P. Tay-
lor, Field Entomologist, Western
Slope Fruit Investigations.

INFLUENCE OF GRAFTING.

While varietal characteristics are
not transmitted by grafting or bud-
ding, there is no doubt about the con-
trolling influence of stock upon scion
or scion on stock in the matter of
vigor.

The case of the dwarfing of the pear
by putting it on the quince root is one
of the most common and also one of
the most conspicuous illustrations of
this truth.

The quince is a slow growing tree
and one that never attains large size.
The root when used as a stock for the
pear holds back the top from growing
as thrifly as it naturally would. This
is a matter of less nutrition rather than
of nutrition of a different kind. If the
roots had been of pear they would have
furnished more nourishment and the
growth would have been correspond-
ingly greater.

The top of a tree or more especially
the amount and character of the foli-
age has much to do with the growth
of the entire tree, both root and top.
If the foliage is scarce and feeble the
entire growth will be contracted. The
foliage plays an important part in
gathering the food supply from the air
and digesting it.

All the woody part of every tree or
plant which may be consumed by fire
originally came through the foliage
from the air. The part that came
through the roots from the
earth is the ashes left after burn-
ing or the fully completed decay.
Hence, vigor of growth largely depends
upon abundant and healthy foliage.

Taking these two parts of a tree,
the root and top, we see that it is nec-
essary to have them well balanced
when grafted or budded together if
the best results are to be obtained.
There must be a healthy and vigorous
top on a stock of the same character if
we are to have plenty of good fruit.—

A Safe, Speedy and Positive Cure for
Curb, Splint, Sweeny, Capped Hock,
Strained Tendons, Founder, Wind
Puffs, and all lameness from Spavin,
Ringbone and other bony tumors.
Cures all skin diseases or Parasites,
Thrush, Diphtheria. Removes all
Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism,
Sprains, Sore Throat, etc., it is invaluable.
Every bottle of Caustic Balsam sold is
Warranted to give satisfaction. Price \$1.50
per bottle. Sold by druggists, or sent by ex-
press, charges paid, with full directions for
its use. Send for descriptive circulars,
testimonials, etc. Address

SWINE.

THE food for the weaning pig is often overlooked in the rush of ranch work, yet there is a period when it pays to be watchful, for a slight check in the growth means additional feed later on. The loss of a few pounds in weight now may not seem to be of much account, yet successful farming, is saving the pennies to make the pounds of money. When the pigs are three weeks old open the doors of the pen and allow them the freedom of the lot. Place a second panel across the end of the pen, eight inches from the floor, cutting off the sow from the manger. Then feed the pigs twice a day all the warm sweet skimmed milk with a little bran mixed in, that they will eat up clean. Feed the sow her slops in an outside trough. Begin to gradually introduce the swill into the pig's milk after the sixth week. When they are three months old they should be on the regular ration of the other swine. When the time comes the sow will gradually wean them and they will not feel the transition and suffer no check in their growth.

Selling Time.

After weaning, take the sow over to regular corral and let the little chappies have the pen and run to themselves until they are half grown up. If these pigs are pushed right along until they are ten months old, they will weigh two hundred or more pounds according to the breed. Then turn them off promptly to the butcher. It is more economical, we have found for us, to sell or dress them at two hundred pounds weight than to hold them longer. We have milk and brewers' malt and alfalfa to bring them along to this weight. After that the hogs seem to need grain to harden the meat, for they have stopped growing and are making meat and fat. When the growth ceases the food needs to be stronger and dryer and heavier to make firm meat. The last pounds put on to the back of a large hog does not pay net returns on this ranch.

One often finds wisdom in strange places yet, when we consider that jingles and saws come from the experienced wisdom of the people, not from the learned men, it is not surprising. You remember this pig story?

This little pig wen to market,
This little pig stayed at home,
This little pig had roast beef,
This little pig had none,
This little pig said
"Wee, Wee! I want to go home!"

Do not think of the dainty pink toes of the baby that cry out in delight over this jingle, but think of it from a pig-feeders standpoint. The first was a pudgy little fellow that was cheaply fed so he went to market to sell at a profit. The next was a slender one, so he stayed at home until he had more fat on his back. The next pig was fed on the best the land afforded; as to profit, that remained to be seen. The next pig had none and was probably a mate to the first one, while the runt or last of the lot wished he was at home. For he thought the farmer would optim-

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

istically feed him for a year hoping for results!

Disease.

Where pigs are raised in unsanitary surroundings, or on low, wet land, and confined year after year, diseases becomes prevalent. The true swine plague and hog cholera are to be dreaded. These diseases are similar in action. A post-mortem being necessary to detect the difference. Swine plague is not believed to be bacterial, while hog cholera is known to have a specific germ. Cleaning up thoroughly is to be practiced in either case.

Hog cholera germ is often carried on the shoes of the attendant as well as by the mud on their clothing. Water also carries the disease freely; I know of a creek that it is not safe to try to raise pigs along, because some years ago, during a seige of this trouble, there lived along the upper stretches of this stream a man whose pigs were dying off rapidly. He offered the remainder to a dealer without saying a word about the trouble. The morning the dealer was coming to see them, ten were dead and as time was too limited to bury them, they were dumped into the creek and floated away to spread the disease along the ranches for several miles.

Safeguards.

Sanitary cleanliness will stamp out any troubles like this in time. We may lose individuals but the race can be saved. All carcasses should be burned, using wood and oil to make a complete destruction of the flesh. Burying as ordinarily practiced will not answer; if buried the earth must be several feet deep over the carcass. Dogs are spreaders of this disease as they seek out carrion. As it is not possible to control the movements of dogs of a neighborhood, we can by burning, put the danger of infection being carried out of their reach.

Whitewash the pens if they are worth it, if not burn them up. Add to the whitewash a 5-per cent solution of carbolic acid. If there are wallows fill those up with earth and cut the hogs off from any running water that may pass along the yards.

Separating.

Remove the well pigs to a fresh piece of ground. A piece of high grain land is a desirable place; build shelters temporarily of poles covered with palm leaves that can be destroyed, if the disease again breaks out. Spray the well hogs with a solution of any of the coal tar derivatives to disinfect them as much as possible. Do not allow anything taken from the old pen to the new place, and have a different man as a feeder. This must be watched as the idea of infection that cannot be seen is little understood among the ordinary people, all this care seeming like fetich rites to them.

One of the government men told me of a case where he had separated the animals and had seen that the whitewashing was properly done and then left after giving complete instructions. He went back the next week and found that the man had put the sick pigs on the new land and left the well ones to sicken in

the old quarters; when asked W. said, "It was all so pretty and w. that I wanted to show visitors hogs in those nice places!"

Remedy.

Cleanliness first, then the following medicine is recommended by government experts:

Sulphur, one pound.

Sodium Chloride, one pound.

Sodium bicarbonate, two pounds.

Sodium hyposulphite, two pounds.

Sodium sulphate, one pound.

Antimony sulphide, one pound.

This antimony is also known under the name of Black Antimony. large tablespoonful of the mixture each grown hog and less in proportions to the smaller ones. The medicines should be given to all the those that are well may be come down with the trouble, while medicine is not harmful but a tonic, if they are free from disease. Give it to those that are eating their slop. If there are some eating, they should be drenched dissolving the medicine or shaking up the medicine in hot water in a bottle, then holding away cheek of the hog from his teeth, put the medicine slowly into the mouth at the side. A hog cannot be drenched by laying him on his back as the fluid will pass into the lungs and cause death.—M. E. Sherman

The Cream of Cream Separators

The Sharples Dairy Tubular is the cream of cream separators—the pick of the whole bunch. Supply can wait low, you can fill it with one hand. All gears enclosed, dirt free, absolutely self-oiling—no oil holes, no bother—needs only a spoonful of oil once or twice a week—uses same oil over and over. Has twice the skimming force of any other separator—skims twice as clean. Holds world's record for clean skimming.

Bowl so simple you can wash it in 1 minutes—much lighter than others—easier handled. Bowl hung from a single frictionless ball bearing—runs so light you can sit while turning. Only one Tubular—the Sharples. It's modern. Others are old style. Every exclusive Tubular feature an advantage to you, and fully patented. Every Tubular thoroughly tested in factory and sold under unlimited guaranty. Write immediately for catalog J-200 and ask for free copy of our valuable book, "Business Dairying."

THE MILK OF THE GOAT.

At some time the milk goat has been talked up as the poor man's milk, but perhaps because no one in the country likes to admit that he is a poor man, they have made comparatively little progress in popularizing the goat. The goat is the cheapest milk producer, for it is said that the milk required for one milk cow is sufficient for eight goats, while the goat produces, proportionately, considerably more than the cow. It is also better quality—that is, richer in fat and much poorer in the less easily digested elements, albumin and casein. It brings it nearer the human than the bovine standard. The percentages in the three milks are as follows:

	Human.	Goat.	Cow.
fat and casein.....	1.885	3.68	4.00
protein.....	5.85	4.50	4.50
lactose.....	4.44	4.73	3.50

THE AMERICAN COW.

There are nearly 25,000,000 dairy cows in the United States, and enough other cattle to make a total of over 90,000,000 head, including oxen, young stock and "flocks" of herds which range to the valley and all condemned to slaughter. There are less than a million thoroughbred cattle in this country and more than 45,000,000 scrubs. The former are half or higher grades. About 100,000 calves are born annually. The average value of a cow is \$22. On Rhode Island, a dairying State, the average is \$39. The cows of the United States produce about 9,000,000,000 gallons of milk a year (watered and unwatered,) the butter product is nearly 10,000,000 pounds (all grades,) and the product of cheese over 300,000,000 pounds. Our cheese industry is making enormous strides. In a short time the output will be 1,000,000,000 pounds. There is one item, a by-product, which is never alluded to in the Mistress Cow or the Sis Cow is considered. Our gold production is about \$81,000,000 a year at present. It is a vast sum of money. Yet the rakings of our cow yards and the fertilization of crops are estimated to be worth cash eight times as much; or \$648,000,000. Such figures are bewildering. They stagger humanity.—New York Press.

STARTING AN ANGORA FLOCK.

Last fall a subscriber living in Inyo county wrote the Cultivator for suggestions along the line of Angora goat raising. As we have had no experiences with Angora the letter was sent to a well-known sheep man for answer. He did not respond, but recently we noticed in the Shepherd's Criterion, an article bearing on the subject of starting an Angora flock. In the main answering the questions asked by the correspondent in Inyo county. This paper says: "It is not essential to pay big prices, \$50.00 or \$100 for bucks and \$10 to \$12 for does, in large numbers, unless one has ample capital and wishes to spend money in large amounts at first." The better way for a man of small means is to begin with a few first-class animals and build up a flock from these. The result will be satisfactory and the only drawback is the length of time required. After all, this may be the

wisest plan for most beginners to pursue, as the experience so necessary to success will be gained as the flock increases. The Turks many years ago began the practice of crossing Angora bucks upon Kurd does. They probably had in mind the twofold purpose of producing thereby a hardier goat than the pure Angora and of increasing the number of goats in order to supply the increased demand of Europe for mohair. Crossing the Angora bucks upon the common goats of the United States, says the Criterion, has been practiced since their introduction and the results have been satisfactory in many respects. Building up a good mohair producing flock upon this plan requires five or six years. The advantages are that the does with which the beginning is made are cheap, costing from \$1.50 to \$2 a head. During the first and second crosses there are many twin kids, thus increasing the herd in that proportion—a condition not existing except to small extent among the pure bred Angoras; the size and hardihood of the progeny are increased and the liability to disease decrease. Care should be exercised in starting a flock by this method to select only such common does as are entirely white for any other color, however slight is objectionable. If otherwise, the results might be satisfactory, but the probabilities would be the contrary. In handling the crosses the breeder often finds that atavism becomes apparent when it is most objectionable. For instance, the progeny for two generations of a doe having black spots might appear all that is desirable, while the third generation would produce the latent color. It is also quite necessary that the common does should be of the short-haired variety.

"In cleaning the separator urges the dairy editor of the Journal of Agriculture, be sure and see that the parts are dried rapidly so they will not rust; still the drying should not be done with a cloth as much lint will be left and on this will be a large number of bacteria. Boiling water will cause the parts to dry rapidly and evenly and will be death to many of the bacteria."

A good deal of the trouble with tainted cream comes from neglect in cleaning the separator. It is some expense in time to thoroughly go over a separator after each use, but it is the only safe rule.

A young housewife writes to ask what are the best utensils to use with milk? In our opinion metal is the best, and if, we follow the text books there would be no seams in the pails or cans. Earthen ware is without doubt superior to any other utensil for it has no joints and can be easily scalded removing every particle of bacteria.

Layers of Fat

Turning corn into pork is paying business, provided the transformation is made with the smallest percentage of waste and loss of time. Now a hog lays on flesh rapidly, so rapidly, in fact, that a few months suffice to double the original weight of a common shote.

To increase weight *three or four times*, however, in the same period that some feeders require for changing a 100 lb. pig to a 200 lb. hog, is to gain the big profits in the business. This can be done, but digestion must be kept at its maximum performance from start to finish—something impossible to do if nature alone is depended on to correct the ills sure to follow heavy feeding.

The preparation which long experience has proved the best assistant Nature can have in maintaining perfect animal digestion is

DR HESS STOCK FOOD ATONIC

It begins its good work right at the foundation by strengthening the hogs' digestion and capacity for assimilation. It is the prescription of Dr. Hess (M.D., D.V.S.) and, besides digestive tonics, contains iron for the blood and cleansing nitrates to expel dead matter from the system. Dr. Hess Stock Food increases appetite in all animals receiving it. A steer or cow fed on Dr. Hess Stock Food will consume large quantities of roughage and extract more nutriment from the whole ration than will an animal fed without it. This is conclusively proved by the analysis of manures from differently fed cattle.

Professors Winslow, Quitman and Binley Dun endorse the ingredients in Dr. Hess Stock Food and thousands of successful feeders testify as to its merits. Sold on a written guarantee.

100 lbs. \$7.00; 25 lb. pail \$2.00.

Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our Government recognizes Dr. Hess Stock Food as a medicinal compound and this paper is back of the guarantee.

Free from the 1st to the 10th of each month—Dr. Hess (M.D., D.V.S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time for the asking. Mention this paper.

DAIRYING FOR PROFIT IN IMPERIAL VALLEY.

The dairying business of the Imperial Valley is past the experiment stages, and placed on a paying basis of good profit on reasonable amount invested. A man coming to the valley may purchase his land, or he may rent as his circumstances will permit. If he purchases improved land with growing alfalfa, he may bring his cows from some section of country where they grow dairy stock or have it for sale and get them in green field of alfalfa at once. He will then be ready for continuous work and constant income that far surpasses dairying in most other sections.

A herd of average good selection of Jersey or Guernsey cows, with good feed and regular attention, will produce \$45.00 to \$60.00 a year. Some herds are doing better than this, without counting the value of milk for calves and hogs which will equal \$12.00 a year or more. A man who tends to irrigating the land, if properly leveled, that will pasture about 100 cows, and milk them, or a professional milker can milk 30 cows, which will make an income of \$4.00 or \$5.00 per cow monthly. Water assessment and fence posts and wire and separator and cans cost more than in other localities according to the difference in freight. Living is a little more, probably 16 per cent to 20 per cent. He sells for \$6.00 to \$8.00 in stacks now and some can be bought for \$5.00.

Pasture for hire can be had for \$1.00 to \$2.00 an acre a month, owing to time of year. January and February brings the highest monthly rent. Renter can procure pasture land for \$5.00 an acre, and pay water assessment, keep ditches and border fencing in repair, and make the same as if he owned the land. Cows are scarce and a high price in the Valley. Renter can rent herds of cows with pasture and some hogs, and rents keep up fences, clean out ditches, do all work of making hay for feed cows and do all work on ranch from first to last and get one-half of the cream receipts, one-half of the increase in cows and hogs as a rental.

Eighty acres of good alfalfa with good care and water, divided into fields so as to pasture one-half while the other half is being irrigated and allowed to grow will feed and pasture about 50 cows; or it will pasture only about 65 cows. In the latter case a ton or a ton and a half of hay per cow will be necessary to make up for short pasturage during winter months when feed is short.

ARTHUR S. FELL
El Centro, Imperial county.

WATER THE HORSE.

It is absolutely essential to the health of the work horses that they should have all the water they wish to drink during hot weather. They should be permitted to take it often at least six times a day, when they will not over load the stomach at any one time. More stomach troubles originate in horses during hot periods, where water is not often given than from any other simple cause. The rule is to give a horse water in the field, or on the road wherever the driver drihks. Water thus given will not hurt a horse.

One part tincture of iodine and eight parts sweet oil or vaseline, applied externally, will sometimes remove obstructions in the cow's teat. Make the application once each day directly over the obstruction and massage well to rub the mixture into the pores.

SELECTING THE BOAR.

Frequently the Cultivator receives letters asking what rule to follow in selecting a boar for the herd. There is no hard and fast rule, but there are certain points which should be well regarded in such selection. About as satisfactory a statement of the qualifications a good boar should have as we have read recently, is the one made by J. D. Cotten, in Farm and Ranch. This gentleman, who is an experienced hog raiser, says: I would select a pig as near a perfect model as we could get, of the breed of our choice. Would want him to have good length of body, but more compactly built and with more finish than if we were selecting a brood

sow, as like begets like, and the boar is considered half the herd. I should be very careful in selecting a pig to keep as a breeding male. We would select him, first, as an individual. Would prefer one out of a large even litter, and one with a strong masculine type, that showed character and vigor, with short broad, head, wide between the eyes and ears, short neck, well arched back, well sprung ribs, deep and full at heart girth, thick, heavy hams, reaching well down to hocks, and well rounded out behind. With straight side and bottom lines (not cut up in flanks), and last, but not least, he should stand on short, stout, straight legs well set, and stand up well on short, broad toes.

In selecting a pig to keep as a

breeder I would look well to his sire and dam as to their individual worth, as to breeding, easy feeding and quick maturing qualities. I would prefer a pig, whose sire stamped his get in a way you could detect and select them out of a mixed bunch of hogs because of their likeness to him and each other. Would select a pig from a large prolific motherly sow, of kind, gentle, quiet disposition—careful mother and good suckler.

I would select a pig with the very best pedigree or breeding record back of him it is possible to get. Would want his pedigree to trace back on either side to the leading prize winning and breeding boars and sows of his respective breed.

There are far too many herds of "all sorts" of cows on the dairy farms of this country.

A damp cow barn is more uncomfortable than a dry one. Ventilating keeps it dry.

For practical cow milking machine see O. J. Weber Co., 555-567 S. Los Angeles St., Los Angeles.

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-567 S. Los Angeles street, Los Angeles.

With the Citrus Growers

PRUNING THE ORANGE TREE.

To understand how fruit trees of any kind should be pruned to secure the best results one should have a general knowledge of the habits of growth and of the characteristics of the particular variety of trees he is about to prune.

It is the nature of the orange tree, the pruning of which is the subject of this paper, to grow bushy and to form a low head. This may be recognized as universally true of those varieties of budded orange trees in common culture in California. But there is a difference, some varieties growing more bushy than others. Among the varieties, the Mediterranean Sweet is perhaps the most bushy, while the Washington Navel, the king of oranges, will come next. And as this last mentioned variety is our recognized standard, what may be said in this paper will have particular reference to it, though applying in a general way to other kinds.

Now in the scientific method of pruning, if this term is permissible in connection with cutting brush, clearly this recognized habit of growth should be kept in view. To try, by severe pruning, to change the habit of growth, cannot fail to result in a ruinous loss of vitality. Nature must be respected, even while we make an effort to correct her faults. Her habits may be modified and guided to a certain extent, but may not be radically changed. This is true throughout all her realms. It applies in horticulture among trees and plants, and the same law holds good among men, in the realm of mind, though as yet but little understood in the educational process of the young.

Recognizing these principles as true, let us take a young orchard from the start, or rather let us go back to the nursery and see that suitable trees are selected.

Of late years, nursery trees have been grown without regard to the natural tendencies of the orange tree, in the effort to cater to a popular fallacy, that the tree should be trained up without laterals until it is four feet or more high. That is doing violence to the tree, and it will be avenged. A bud, unless it is unnaturally stimulated by fertilizers, will seldom grow more than twelve or fifteen inches before it sends out branches enough to form a bushy top. And pinching these branches off and pushing the stem up until the fashionable height is reached is taxing the vitality of the tree to an extent that can but be injurious. I would not, however, leave nature entirely to her own guidance. I would rub off the laterals until the stem is two feet or two and a half feet high. Then I would let three or four branches grow, but instead of letting them turn down as is their nature, I would draw them up and tie them to the stake in such a position as I wished them to remain. Thus each main branch, developing into what may be termed a secondary trunk, may be kept in an upright position, while the smaller limbs may hang down. In this way you give the tree all the advantages of a short trunk and bushy top, while at the same time, by a little thoughtful art, so training its growth as to obtain all the advantages of a single high

stem. And from careful observation and experience, I feel safe in saying that a tree trained in this way, other things being equal, will at the end of five years have doubled the growth and the bearing capacity of the tree trimmed in the fashionable style.

Pruning Necessary.

After young trees are set in the orchard, what pruning, if any, will be required the first year? If the trees have not been spoiled by methods, scarcely anything will be needed except to rub off superfluous sprouts, which are sure to be pushed out in the effort to overcome the checked growth and deranged condition resulting from transplanting. If a proper top has been developed in the nursery and leaves left on, new growth will soon start in abundance from the bare branches, where the new top is to be formed, and little trouble will be experienced by growth starting from the trunk near the ground.

After transplanting, the all-important point is to get new growth started quick and in the right place. This is scarcely possible if it has been taken from the nursery with a bare trunk four or five feet high. The checked growth and shock caused by transplanting will, in that case, cause the tree, in obedience to its own nature, to push out a multitude of shoots near the ground. And it usually takes time and great loss of growth before the sap vessels will freely carry up through that useless trunk enough of sap to start a vigorous growth.

For four or five years after being set in the orchard the trees will require what comes properly under the head of pruning. Whatever growth starts on the trunk below the top should be kept off. Branches which grow too long should be clipped, or the tender young growth pinched off, the branches which chance to be injured by frost in the winter should be carefully removed, as carrying dead wood does the tree no good, and your neighbor who lives just over the way, on whose ranch the mercury never falls below 30, however cold it may be, will be greatly shocked to see how the frost has injured your trees.

Remove Dead Twigs.

As the orchard comes into good bearing, a multitude of little twigs in the thickest part of the top will die, and should be carefully removed. But in doing this work only dead-wood should be taken off. Small branches which are still green should be removed, even though they show little fruit. They are useful as long as they remain green. And if these little branches are taken off the main limbs, suckers will start out with vigor, and divert the sap from bearing branches, doing serious injury, apart from the labor required in keeping them off. In going over the trees, such of the lower branches as have come down too much in the way of the cultivator should be taken off. However, it is better, even on these troublesome branches, to use the shears sparingly. But the idea which has frequently been advocated that the whole top of the tree should be thinned by cutting out many branches so that the sun may shine through it, in practice is simply ruinous. It has been urged that this will relieve the

tree of scale pests, on the assumption that the heat of the sun will kill them. But careful observation will show that both the black and brown scale will prosper on surface limbs where they receive the direct rays of the sun. I have made careful examination touching this point and find the bugs on branches on which the sun shines all day apparently in robust health.

Let him who uses the shears on the orange tree bear in mind that the leaves constitute the laboratory, or workshop, where everything that enters into the substance of the tree or its fruits is brought into available form. Hence, whatever robs the tree of its leaves, be it the pruning shears or a fierce norther, takes away to the same extent, the productive force of the tree, and leaves us poorer in pocket.—B. Edmiston.

IT'S PENNY WISE.

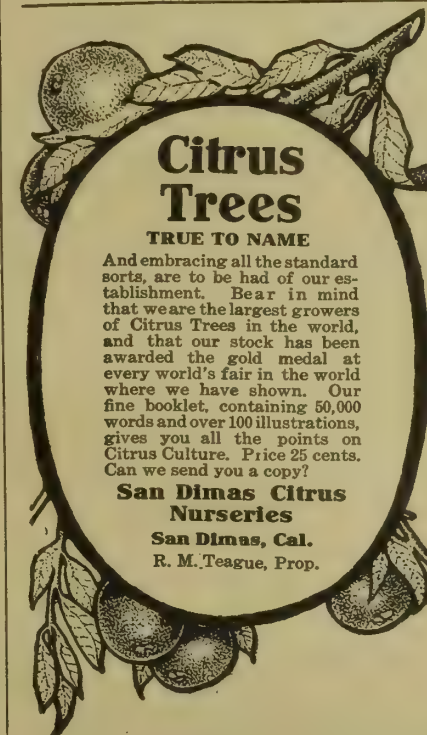

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

MORTGAGES.

Men spend years mastering the details of their business. They seldom have time to get more than a superficial knowledge of other lines—especially of one so intricate as that of safely investing money.

If people with money to invest were always or often able to safely make their own investments, there would not be a need for the investment houses, but never before has there been such a need for careful, conservative investment houses as there is today.

Our own success with investments is attributed to years of study and experience in banking and the judging of credits. Our officers have spent years in the banking business—one of them more than forty years—and this training has impressed on them the value of safe and conservative loans.

We provide safe and conservative mortgage loans for our customers: such loans as we have put our own money into and that pay six per cent. interest, per annum, payable quarterly. Those in need of such investments are invited to call or correspond with us.

The Vegetable Garden

THE HOME GARDEN.

THERE is no country under the sun so favored in the growth of small fruit as the Pacific Coast, so there is really no reason why every owner of a plot of ground should not have a supply of the different berries for the table. Grown for home use it is a pleasure to care for them, and to pick the large luscious berries washed in the sparkling dew of early morn is a joy. And then compare such berries with those purchased on the market, that are covered with the dust and filth that is blown around the streets of the large cities. But few plants are required for an ordinary family, 100 to 500 strawberry plants if properly cared for is a great plenty. Two or three dozen each of blackberry and raspberry plants take up but little space and would furnish enough for the table and for canning. A row of Loganberries or Mammoth Blacks trained along the fence would not only furnish an abundance of berries but would cover what otherwise might be an unsightly spot. If you have a rod of ground that you can call your own it is a duty you owe to your family and yourself to improve it with fruits, vegetables and flowers.

In raising berries for the home or for market it is necessary that the ground be properly prepared. It should be spaded or plowed deeply and thoroughly worked until every lump is worked out. The ground may be fertilized with barnyard manure, but only that which is well rotted should be used. Among all the berries grown strawberries are most favored and in the Southwest can usually be picked every month in the year. For the home garden they may be planted in beds four feet wide and any desired length, or they may be set in rows eighteen inches apart and seven or eight inches apart in the row. Planting may be done any month in the year in those portions of the country where irrigation is practiced, but ordinarily the fall and spring months are most favorable. If planted in August or September one can be quite sure of picking berries two months from planting, and then fall planted vines will usually bear a bigger crop the following year than those planted in the spring. The plants may be set out with any ordinary garden trowel but should be planted so the roots are not doubled up. If planted in the summer time or early fall before the rains, the ground should be well irrigated before planting and immediately after planting, and every other day until the roots are set and then about every four days. If planted in rows they may be cultivated with a hand cultivator and should be cultivated at least once a week. We believe in plenty of water and cultivation. Plants set out in the fall will not make so many runners as those set in the spring but all runners should be kept pinched off if you want lots of big berries.

Blackberries, Raspberries, etc.

Blackberries in the home garden should be planted in rows six feet apart and about four feet in the row. This is also the usual distance for raspberries and Logan berries. Blackberries should be cut back every summer to about four feet and raspberries to about two feet and a half in Southern California and the hot interior valleys. Further north they naturally make a bigger growth. After the

spring crop is over, cut out all old growth that does not show life. There may be a new growth of laterals on last year's cane. Logan berries may be allowed to trail on the ground but are much better on a wire trellis, as the old wood can be cut out better and the berries are more conveniently picked. Care should be used in cutting out the old canes of the Logan, as many of them will have new laterals from which one can get a fall crop and where such growth is made later in the season they will bear in the spring and two or three weeks earlier than from the new canes. Where irrigation is not practiced all vines should be mulched during the summer time, cultivation being done in the spring.—G. H. Hopkins in his catalogue of Small Fruits.

ANTHRACNOSE OF THE BLACK-BERRY.

This disease has been very prevalent during the past season on blackberry and raspberry bushes and in many cases it has rendered the crop unprofitable and stunted the growth of the plant. This is one of the group of fungus diseases, and it usually attacks the young growth, starting on the young canes near the ground. It makes its first appearance in the form of small purple spots, which soon increase in size and number and involve the whole cane. It also attacks the leaves which blister and curl downwards. If not checked, the disease will ultimately kill the plant, as it attacks the tender growth and checks its maturity. For this, as for all fungous diseases, the best remedy so far known, is the Bordeaux mixture. All old canes should be removed and burned early in the season, thus destroying any spores that may be on them. Spraying should be done early in the spring before the shoots start out and at intervals afterward. It will do good if the ground under the bushes is sprayed too, and the young shoots looked after as soon as they appear above the ground.

MORE TOBACCO.

As the subject of tobacco raising in California has attracted some attention of late, Mr. H. E. Owen of Burbank writes the Cultivator as follows:

"I have successfully grown, within 12 miles of Los Angeles, about 900 tobacco plants which I have just harvested. They are now in process of curing. The plants are as nice as you would care to see, and have the real southern smell and flavor.

They were grown about one mile west of Burbank in the San Fernando valley. If I am successful in curing this tobacco we will all have a smoke of pure undiluted Havana. I have two varieties: Havana and White Burley."

Beware of the irresponsible tree seller. Stick to the nursery firms that are known to be honest and have a reputation to sustain.

For almost any kind of small fruit the land should be deeply plowed, thoroughly cultivated and well fertilized

Pack your apples in boxes so the fruit can easily be seen and you will be well repaid for the trouble.

FOREST DESTRUCTION IN COLORADO.

Speaking of the havoc wrought with the scenic attractions of Colorado, the Denver Republican says: "Travel where and how we may our mountains, the eye is met with the charred remains of forests and desolate by fire, or laid waste by ax. Attractive as our mountains are how much more so would they be they were as verdant as the slopes and precipices of Switzerland!"

To such a condition has the point of unregulated private exploitation brought the Switzerland of the West. Some of this desolation can probably never be redeemed. Man is the animal which wastes his birthright and seeks to destroy the very plant on which he lives. The vandalism of the individual can be met only by the exercise of the conserving and restoring power of the whole people. What ever may be possible in the way of saving something out of the wreckage in Colorado and in healing the scars inflicted by private money grabbers, the Forest Service is doing and will do.

Olive oil is superior to lard or butter as a frying medium. Meats, potatoes, in fact everything to be fried in a skillet, taste better for being cooked in oil.

The Ornamental Garden

COLOR HARMONIES.

GROWTH in California is prodigious, and blossoming is almost constant. Vines which in colder climates bloom once a year in greenhouses are in bloom here for months out of doors. I have in mind the peculiarly colored Bougainvillea as I write. The vine grows to enormous proportions and is in bloom many months in succession. It is a beautiful sight by itself, but what a trial it is when crowded near anything of any color but white. I put my vine at the back of a greenery corner. That is, the foreground was filled in with green grasses, papyrus, umbrella plant and the eulalias. It did very nicely as a background, climbing over a high fence. But in course of time I made discoveries.

I had a very handsome geranium of a peculiar shade of magenta with a white eye. I plucked a spray of it one day and went along to the Bougainvillea and discovered it was of the same tint, only lighter. I did not have any plan in my mind, simply thought that there was one thing which would harmonize with the Bougainvillea. But later in the season when the dahlias were in full bloom I was distressed to find next a glowing scarlet, a very handsome purplish magenta one, and next a brilliant orange variety a pale lavender one, and so on; all through the bed there were clashings of color. Suddenly one morning, as I stood off at a distance looking critically at the combination in the bed, my eye swept toward the Bougainvillea. Instantly I saw color harmonies for the greenery corner. At once the gardener was put to work to spade up a huge half circled bed in front of the grasses. It was well enriched and bordered with bricks. Then into it went all the peculiar shade of dahlias which harmonized with each other and the Bougainvillea and magenta geranium was cut up into many slips and set in for a border alternating with a pure white double geranium. Well, plenty of water and our sunny climate did the work. Of course, the dahlias died down and were cut back, but they sprang up again and in two months that corner was not only beautiful, but growing famously. I think I take more genuine pleasure in looking at it than in anything in the yard.

The colors are so different from the reds and yellows that they are restful, and the shadings and harmonies of the colors are particularly grateful to one's sense of artistic effect.

Delighted with this result, I turned my attention to another difficult color. That is the orange peculiar to the tiger lily. Now a double tiger lily is just as handsome as it can be, provided there is nothing harsh near it. Among the lilies of the same shade are the superbums and the Montbretias. These were in different parts of the garden where they could glorify some isolated spot. They could very well be arranged together in some place where there was a suitable background. That must necessarily be green, so after looking about for sometime, I discovered a place where there was a background of a huge pampas grass, and a nearby Bird of Paradise shrub. Now its flowers combine that odd orange yellow which the lilies hold, with a

brilliant scarlet, so that a bed was made in this vicinity for the lilies, and there they glow in the August weather.

It takes time and experience to harmonize one's colors and arrange the blooming time of different plants simultaneously. For instance, the lavender Solanum Grandiflora, blooms at the same time of the year that the pale pink Tecoma blooms. Both being vines, I planted them some three years ago to cover a little brown garden house. They have grown and thrived, and cover the end and side and roof of the little house, and are an exquisite blending of color, both being in bloom at the same time. But inadvertently I placed Madam Pollock geraniums in the bed in front of the shed, and while they were not in bloom their pretty leaves made a very attractive border for the vines, but unfortunately, Madam Pollock likes to bloom as well as the rest, and the bright scarlet blossoms kill the delicate lavender and pink. But as soon as the lavender plants cease blooming, I shall have them placed in the bed ousting Madam Pollock and the gray of the foliage will be beautiful there, and the tiny lavender spikes will harmonize with the flowers on the vines, and all bloom at the same season.

The brown lath house is covered with vines. They are placed with considerable thought. For instance, the Bignonia Venusta blooms in the spring of the year. It is an impossible yellow, very handsome, but needs to ruminate by itself. After it has gone by the pale blue plumbago, than which there is nothing in plant life of such an exquisite shade, comes into its own. A white moon flower and a white clematis is also run riot over the lath house. There is a Bignonia Tweediana attaining size there and its pale yellow bells are very lovely with the plumbago. Another year and the lath house will be lost to sight by the riot of these vines, as each grows to enormous proportions in course of time.

Vines are the most satisfactory of plants in the sunny southland. They make for shade and their blossoms add to the beauty and brilliance of the scene, but great care must be exercised in placing them, due regard being given their colors and their period of blooming. They are rapid growers and ample space must be allowed them, and much judicious trimming and training is necessary to their development for greatest beauty.—Georgina S. Townsend, Hollywood.

Of all tree products, none are so safely and economically marketed as nuts. There is no need to rush them to market, no need for costly refrigeration; they are not perishable and can go by slow freight in any convenient package.

With the wheat, corn and oats crops estimated to aggregate four billions of bushels, there will be no lack of something to eat in this country during the year, and somebody will have work to do in hauling it to the mouths into which it will disappear.

Dr. Elwood Mead, chief of the bureau of irrigation investigations, of the U. S. Department of Agriculture, has accepted a similar position with the Australian government at a salary of \$15,000 a year.

Imperial Valley Farms

Wonderful Opportunities for "Real Farmers."

Cantaloupes, Grapes, Onions, Asparagus, and all garden produce get the early market and thus the high prices.

Alfalfa, Hogs, Dairy Cows, Sheep and Beef Cattle cannot be raised anywhere with greater profit.

The great need of the Valley is for "real farmers." At present you can buy lands at the same prices as some improved lands are now renting for. The Valley is fast becoming the Great Feeding Ground of the Southwest.

Cantaloupe and garden land to lease for cash or on shares.

INDIAN CORN.

With the extension of irrigation in California and the influx of settlers from the Middle-West, will come a greatly increased acreage of Indian corn. This cereal has long been recognized as one of the best grown for man and animals. It will yet be grown in this State, especially in the northern and central sections, as a general crop.

The Des Moines, (Iowa,) Capital, pays Indian corn the following deserved eulogy:

Corn was found growing in America when the white man arrived. The world has known nothing about it before. The natives had planted it for generations in Mexico and Peru. Its progress from that time as a food product has been steady, but not rapid. Europe has been slow to consider it as food for man. Corn is a product peculiar to the colder climates. And anything grown in the colder climates is characterized by solidity and substance.

It is a plant of annual growth and the soil gives more to it than it gives to any other growing plant. It is clean, for all that comes from the soil is clean. It produces the most solid meat and gives out no filth. The stocks become stalwart under the inspiration of sunshine and rain. It is the highest type of annual soil product. It is not

a fruit, nor vegetable—it is grain, golden grain. When waving in the fields in August, it suggests the sea. The stalks bend in the wind and the green blades rustle. Thus an unrivaled picture is presented.

The storms of winter cause it to be appreciated. The yellow ears contain strength and heat. The green blades ripened to brown, retain all their life-giving properties. Crops of corn outside in the snow are superior to the elements, and suggest independence and comfort. It is not soft and mushy, it is solid and substantial. Corn is the type of plenty. It is the friend of man and beast. Strong people come from the corn States and the corn climates.

Where agriculture is practiced in the plains region, the farmer will find it profitable to devote a few acres of good land to trees. It is true that some time must elapse before the plantation will become productive, but, by choice of rapid growing species and by close spacing, the thinnings which will be necessary in a few years will provide material suitable for fuel and stakes.

HE BOUGHT A GOLD BRICK.

The Cultivator has time and again cautioned its readers to beware of the "gold brick man," in the guise of an agent, taking orders and requiring payment by a note. These crooks are afloat in every section of the country and the damage they do to legitimate business representatives of established houses is worse than the damage done by the White Fly to the orange groves.

We find in the Kansas Farmer of recent date a case which is quite common. Bogus agents of stock and poultry foods, of nursery stock and many other farm necessities, are today scouring the country in quest of just such blockheads as this Kansas man showed himself to be, and when they find their man they gold brick him to a finish. Here's the scheme the Kansas innocent was taken in on as detailed in the Kansas Farmer, the principal agricultural journal in Kansas. We quote:

"Editor Kansas Farmer:—A certain man representing the——— came to me in the field and desired that I handle his stock food on a commission, he doing the advertising. I was to furnish the names of all the farmers within the radius of a half-mile drive and he would send the advertising letters, pamphlets, etc. Within about two weeks of the time I gave the order I was to receive the stock food and at my request I was to send for a man to go with me through my territory and show up he food a his expense, introducing him to the farmers. I was to sign a note for the food due in six months. This I did. In case the food did not sell I was to be allowed the privilege of returning same and he was to return the note. I sent the names of the farmers and after a while received word that he had received the names and would notify me at time of shipment.

I never wrote to him again and never got the food.

He cashed the note the same day at the bank and went away. The amount of the note was \$130 for 2,000 pounds of food at 6½ cents per pound.

There was only one witness to the transaction, the livery man who brought him out. There was no written contract, but he gave me a copy of the order. He never sent the advertising and did not comply with one agreement. After several weeks the banker wrote to Bradstreet at Kansas City, and after several days wrote to Dunn at St. Joseph. He received answers from both of them intimating that the man's business was crooked. Since that I have done nothing save consulting a lawyer who told me to have him arrested and brought back here.

The only thing I fear should he be pressed would be to send me a ton of stock food, probably worthless stuff. As I don't want to handle the stuff I would like to get my money back and I would be satisfied. Can I do anything with the man and can I get my money back if he is worth anything? I gave the order for the stock food in May. What recourse have I and what do you advise?
X. X. X."

To this letter the Editor of the Farmer replies:

Perhaps the cheapest way out of a case like this is to pocket the loss, charge \$130 to education, and to be wiser in the future. Possibly an arrest of the swindler might result in a refund of part or all of the money; but there is also the possibility that he would cause the shipment of a ton of something in fulfillment of his contract, and that this shipment, though unreasonably delayed, might be sufficiently near to

meeting the conditions to nullify the prosecution.

The outcome of a suit for recovery of the money would be exceedingly uncertain. There is a homely old adage which says "sue a beggar a catch a louse." Most persons who engage in this kind of swindling operation keep themselves "out of court" so that the result of a lawsuit against such a one is usually expense and no payment of court costs by the person who sues.

The moral is, "Never buy a gold brick." There are excellent stock foods which are manufactured and sold by reputable people. If one does not know how to reason to believe in the responsibility of these people, seeing their advertisements in home papers or other reliable farm journals, he can nearly always get the information by inquiring of the local banker, just as was done in this case, when it was too late. If this method is available write to the editor of any good paper before closing the deal. Very likely the sharer who is trying to "do you" will make it appear very unreasonable for you to hesitate. He knows how to make it look like the reasonable plan to close the deal immediately and very ridiculous to suspect him or his intentions. New mind about that. You have made a living for these years and can exist for a few days longer without engaging with a party of whom you are not informed.

One hundred and thirty dollars is a good deal to pay for such a lesson but it may be worth the money.

THE SECRET OF LONG LIFE.

Cultivator readers will be interested in reading the result of an investigation, made by a noted German physician, on the subject of longevity.

He has endeavored to learn in which countries the greatest age is attained. The result shows that the German empire with 56,000,000 population has only 78 persons who are 100 years old. England and Scotland with a population of 37,000,000 have 192 who reached their one hundred birthday. France and Spain have 213 and 41 centenarians, respectively, while the United States, according to the latest statistics, has 350.

In this connection, of interest also, is the advice given by Dr. John B. Rich, a native of New York, who is believed the oldest living native of that city, being over 98 at the present time, sound mentally and physically, appearing no to be over 60, with strong voice and elastic step. His advice is all the better for the reason that he lives by his precepts, and his eye and condition render him qualified to lecture his fellow-mortals on diet or anything that he sees fit to talk about.

Dr. Rich's first proposition is that we eat too much. This has been said before, but never with greater authority. "Two meals a day are enough for anybody," he asserts. "Almost every one eats twice as much as he needs. All through my life I have endeavored never to put anything in my stomach that I did not know my stomach could digest." In addition to these rules, Dr. Rich advises us to keep our feet dry and avoid worry. These rules sound well, and he has proved that they WORK well. By following them he has lived nearly to the century mark, and states that he is now as busy as he ever was in his life.

Practically all recent scientific investigations bear out the statement that people, especially those of sedentary habits, eat far more than they need and far more than they can assimilate. Under this process it is only a question of time till there is a breakdown. By keeping the mind healthy, hopeful and active, and by following a few simple and common-sense rules relating to diet, cleanliness and sanitation, there is no reason why the health should not be improved and longevity increased.

In Germany it is not a common thing to find centenarians, except in Roumania, where there is a proportion of one centenarian to every thousand inhabitants. In this country, the rules of diet, sleep and health are made subservient to wealth, otherwise we would be able to present one of the highest rates of longevity of any nation on the globe. We are living too fast. Dying before our time.

Agricultural Notes of the Pacific Coast

Northern California

Interest in vineyards is increasing in Sonoma county.

Geyserville is taking steps to organize an agricultural club.

The hop crop about Healdsburg is third short of last year.

Placer county held a good district fair at Rocklin last week.

Glanders has broken out among the horses of the Napa State hospital.

New winery built at Healdsburg by Scatina, is handling large quantities of grapes.

The prune crop at Anderson is promised to bring \$250,000 as result of this season's output.

Two hundred Indians came from Nevada sections to pick hops in northern hop fields.

Reclamation District No. 744 is to raise \$91,000 to pay old debts and to make new reclamation works.

Twenty-five carloads of mutton sheep were loaded recently at Anderson stock yards to be shipped south.

Wine grapes are being shipped out of Woodland owing to the trust winery not running there this season.

A new irrigating canal has been opened at Woodland recently, water being received from the Winters canal.

Ninety-five carloads of fresh grapes were shipped in one day last week by the California fruit distributors through Sacramento.

The fruit growers of Yuba county are agitating organization on the co-operative plan, believing thereby, to increase their profits.

Elwood Mead, formerly of the United States Department of Agriculture, has accepted a position at the State University at Berkeley.

A bean grower has been experimenting with Lima beans near Susan and maintains that it will be a successful crop in that section.

Davisville Almond Association sold their 1907 crop under sealed bids, the public not being informed as to the exact price.

David Starr Gordon maintains that "coolie classes" of all nations should be barred from this country. He refers not only to Asiatics, but to Europeans.

Says the Register: The grape crop in the Napa valley for the season of 1907 promises to be a large one. The vineyards never looked more thrifty than now.

Peaches were sold in Sonoma county last week at prices ranging from \$45 per ton to \$65. Freestones sold readily at \$60 per ton. Sonoma county is a fine peach district.

The Yolo Democrat reports the extent of the work of the State Farm at Davis to be far more extensive than farmers generally suppose. A big creamery plant will be put in operation there by the first of November.

A section of Montague in Siskiyou county expects to enter into the cattle breeding business more than in the past. It has heretofore been a feeding and fattening ground for cattle and horses raised in Eastern Oregon and Northeastern California, but recently other outlets have been found for that stock so that those rich lands must provide their own stock for pasturing.

Central California

Raisin prices are still holding firm. San Jose has an "outing farm" for city children.

Five and one-half cents have already been paid for raisins.

The Industrial Exposition of Stanislaus county is being held in Modesto this week.

Lodi grapes are being picked at a rapid rate, and the winery there is crowded to its limit.

A couple of Fresno raisin growers have a wager that Muscat raisins will yet reach six cents.

Lodi grape festival was celebrated last week. Queen Zinfandel had supreme control of the town.

Central California Bee Keepers' Association held a meeting recently at Hanford addressed by Prof. Rankin.

The Turlock Journal claims that its cantaloupes have been pronounced superior to the famous Rockfords of Colorado.

The sinking of wells recently in Section 29 near Bakersfield, has developed an almost inexhaustible supply of water.

The president of the State Board of Agriculture has the following from James Wilson, Secretary of Agriculture:

A new raisin seeder invented at Fresno on a thorough trial is proving satisfactory and it is hoped will break the raisin seeding combine.

At the recent raisin festival at Fresno that county exhibited some fine looking corn and is now planning to be almost equal with Iowa as a corn producer.

The raisin driers were given a start last week by the prediction of showers by the weather bureau, which would have done great damage. Fortunately the weather bureau was wrong.

Kingsburg Recorder is publishing a column of reports from fruit growers which show exceptional returns. Amongst the items is that of one grower with fifteen acres of peaches who secured \$4000.

Raisin growers of the San Joaquin valley are urged to form "stand pat" raisin clubs in their school districts. The idea being to create a sentiment looking toward securing for the grower a full price for this season's output.

Your letter of August 29th, in acknowledgment of my telegram, is received, and I am much pleased with it and with the information you give me to the effect that matters in the fruit trade are adjusting themselves. We will try to take care of your people over here.

The United States Consolidated Seeded Raisin Company has asked for an injunction against the Chaddock Company forbidding use of the newly patented raisin seeder. The Chaddock Company, however, claims its invention is in no sense an infringement on the older seeder.

The Porterville Enterprise calls attention to the fact that White Fly fungus has accomplished much in Florida in eradicating the White Fly, but bear in mind that all fungus calls for a moister climate than California has, to accomplish much in eradicating anything as prolific as the White Fly.

Southern California

Coachella reports the sinking of a large number of Artesian wells.

San Fernando Press is appealing for reorganization of its farmers' club.

Thousands of acres of pasture were burned back of San Jacinto recently.

Three thousand head of thoroughbred ewes is the latest importation into Imperial.

Anaheim walnut growers are urging the combinations to fight walnut dip patents.

El Modena ranchers are putting out peas, beans and tomatoes for the winter markets.

Large shipments of Cornichon grapes from Riverside is proving very profitable to growers there.

Government officials plan to collect fifty millions pine seeds for mountain nurseries for reforestation.

The San Bernardino Fruit Exchange will ship over twelve hundred cars of oranges next season.

The Rialto Orange and Lemon Association plans for increase in its packing capacity the coming season.

Highlands is still holding meetings and discussing plans of ditches for carrying away its storm waters.

Burbank reports the largest output of grapes ever in its history, over forty thousand tons being the output.

The Ojai orange growers are organized to protect their interests, especially any infestation of the White Fly.

The pear crop at Hemet this season will amount to three hundred tons. Most of the fruit was shipped green.

The lumber dealers have met in Los Angeles and fixed a price of 19 cents on orange box shooks for the coming season.

Early planters are already looking at the green fields in the Imperial valley, for the earlier grain plantings are already up.

The price of walnuts this year, together with the output which is now found will be larger than anticipated, is making walnut men smile.

Twenty-five scrapers are at work on the Colorado river levee near Yuma giving assurance of greater strength for the next flood season.

The Anderson-Barngrover Company is continuing its fight against the walnut growers of every section of the south which used chloride of lime formula in bleaching.

The Redlands Citrograph says that the idea of special trains for hogs which are made out of the Imperial valley is hopeful, because it indicates that the rest of the folks will now have a chance.

The Imperial "Vigilance Committee" an organization brought into being to put an end to the land jumping by squatters who were after choice locations, is in readiness for business in case of need.

Some southern papers are recommending early planting of grain to get the advantage of earlier rains which some are predicting. Some of the best grain growers maintain that no grain should be planted later than January 15th.

The Coast

McMinville, Oregon, fair will be held next week.

The State Fair at Salem, Oregon, was held last week.

A new cannery is putting up peaches at Free Water, Oregon.

Indian hop pickers have been used in the north Yakima hop fields.

Salem, Oregon, reports alarming quantities of mold in its output of hops.

Shortage of harvest hands is the cry in the grain fields near Pullman, Washington.

One firm has bought one hundred and ten carloads of La Grande, Oregon, apples.

The grain of the Lewiston country is said to run between ten and fifteen million bushels.

A preparatory class in agriculture is to be established by the Idaho Experiment Station.

The Hazelwood Creamery Company lost its branch house at Portland in a fire recently.

The quantity of Oregon hops is said to be exceptionally good, and is now practically all gathered.

Grain in the vicinity of Washtucna, Washington, is expected to be all harvested by the end of this week.

A rain storm in Eastern Oregon and Northern Idaho about the first of the month did much damage.

Over \$4000 worth of choice fruit was shipped from one forty-acre ranch near Garfield, Washington.

Pendleton, Oregon fair September 23rd to 28th. Spokane fair will be held September 23rd to October 5th.

Apples are being quoted at Hood river, Oregon, for Ben Davis, Jonathan and Winesaps, at \$1.60 to \$2.25.

The Northern Pacific has failed to furnish cars to the hay growers of Northern Yakima and loss is feared.

The Tacoma Poultry Association will hold its annual meeting at Tacoma, Washington, December 10th to 15th.

The dreaded disease, black leg, is said to be attacking the spring lambs in the northern part of Washington.

The market men of Tacoma, Washington, claim the farmers are bringing in their old stored eggs as strictly fresh.

A continual scrap is on between Japanese and Chinese employees at the canneries at Bellingham, Washington.

At Tacoma, Washington, there is almost a hay famine because of farmers refusing to ship in at present quotations.

The Hazelwood Creamery Company, of Portland, is investigating conditions in Northern Sacramento valley with a view to establishing branch creameries.

Malheur and Klamath counties in Oregon are greatly puffed up over their success for winning trophies for irrigated fruits at the National Irrigation Congress.

Bankers of Washington are backward on advancing money on the hop crop owing to the low price, and some have claimed that fifty per cent of the crop of that State may remain unpicked.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hazardous feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledge standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet, "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co.

Also Pioneer Manufacturers of High Grade Indiana and Yolo Sts., San Francisco, Cal. **acornova.** Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

FOR THE BEGINNER.

WITH the opening of fall fairs, we might say the show campaign is upon us. This is a favorable time for the development of that most infectious affliction, "hen fever." The long rows of fine fowl in the pink of condition; the special ribbons displayed on the coops of the winners; the display of dressed poultry; the even shape, size and color of eggs; the bevys and flocks of admiring spectators, listening to the successful exhibitor, all have a tendency to start the germ, and ere we know it our fever has registered at 103 degrees and our only cure is a pair, a trio or a pen of thoroughbred fowls. The result of this sudden rise in temperature will be different in different people. With some it will die on the fifth day, others on the ninth day, while others it will fall about the 17th day, but with the true fancier it will last 21 days and he or she will find that the case is incurable, and the poultry fraternity will have gained a life member.

Selection of Breed.

After having arrived at the conclusion that it will be impossible for us to live without a few hens, the question naturally arises: "The selection of a breed." What branch of the industry shall we follow? Will it be fancy poultry, market poultry or eggs?

Upon our decision will depend somewhat our selection. If we expect to raise broilers and market poultry, some one of the heavier breeds will be best, but if we expect to confine ourselves to the production of eggs, we should take the Mediterranean.

The Fancy.

Perhaps the breeding of fancy poultry offers the widest scope for one with artistic tastes of any branch of the industry. For is not he who can by selecting, mating and breeding, produce color and mold shape as much an artist as he who, with paint and brush, portrays the same on canvas?

Whatever breed we decide upon, our advice is to carefully study them and learn just what is required for an exhibition specimen. Get a standard, study it, learn the form of the bird that you may know when you raise or buy a bird where it is good and where it is deficient.

In giving advice as to the selection of a breed we always give the same to all, that is, to select the breed you like best. You will find the successful breeder always loves his birds.

Cost of Production.

If your space is limited we would advise exhibition stock. While exhibition birds should have as much room in proportion as the utility bird, yet the returns will be greater. So less room will be required to produce the same aggregate return. Then, too, if we only have a few birds we can give them closer and better attention.

Another thing for us to consider in exhibition stock is, that while the first cost is greater, the cost for feed

is no more than the ordinary kind. At the same time the returns from eggs and stock are far greater. **Purchasing Breeding Stock.**

Having made up our minds as to what branch we expect to take up, the all-important question is in selecting and buying our breeders. Although now may seem to some to be between seasons, yet it is a splendid time to buy. First there are many who, having had good success raising young stock, will sell their breeding stock at a moderate price. Should you buy young stock get as well developed as you can find, and from some reliable breeder. There are many advantages to the earlier buyer.

No matter what branch of the business you enter. The chief reason for getting our birds early is to get them yarded and acquainted with their quarters before the breeding season starts. It also gives you a chance to study your birds and learn something of the characteristics of the breed you have chosen for a partner.

AROUND THE YARDS.

Whole grain is best fed at night.

Sunflower seed fed to fowls in small quantities gives a glossy effect to the feathers.

Change of food is good for growing stock.

No business pays better on an investment of small capital or so quickly developed than poultry.

The incubation of chicks and the shipment by express of the young birds alive to customers is becoming quite a feature in the poultry business. In some ways it is thought to be better than shipping eggs intended for hatching.

Ducks to be most profitable must find a considerable portion of their own food. They will be most likely to do this in a situation where they have access to small streams and low marshy lands which afford food such as they relish in abundance.

First Hen—Have you called on Miss Pullet who moved into the yard last week?

Second Hen—Not I; she is not of our set at all. Why, she is one of those common incubator fowls with no ancestry whatever.

Road dust is the best thing for the dust bath. You should collect your winter's supply while it is plentiful.

Harvey Robbins of Santa Paula, Cal., writes us that a Rhode Island pullet hatched Feb. 1st, brought off a herd of chicks August 14, and that her other brought off her third brood August 21. This is certainly very good and there is no indication of "race suicide" here.

Don't waste a dollar's worth of time and medicines on a two-bit bird; better cut its head off than spend the time in trying to locate the snipe.

Success depends not so much on the breed, variety or strain, as it does the man behind it.

GREEN FOOD AND SHADE.

It is a constant surprise that poultrymen so much neglect two very important aids to the comfort and well-being of their flocks, two things which promote the health and growth of the youngsters and keep the health and strength of the layers, equally; the two things are green food and shade from the hot rays of the sun. When we have asked men why they pay no attention to those two things the answer has almost invariably been, "Why! They take care of themselves!" But they don't take care of themselves, unless both fowls and chicks are on free range, and on range which is comparatively fresh and uncontaminated.

Some Reasons.

There are the best of reasons why we should take care that green food is always accessible. First, it is good economy, as it reduces the consumption of grain-food; when a chick or fowl has eaten heartily of greens it will eat a third to a half less grain. Second, it satisfies the warm weather appetite and cools the food; also it stimulates the action of the bowels and promotes digestion. It was interesting to learn, when talking with the poultry fatteners in the Surrey district of England, that they boil nettles and mix the liquor to the food, to cool the blood and keep the system in good, healthy condition.

The green food which a fowl or chick eats much of when ranging at all serves just such a purpose, cooling the blood and toning the system; green food is to fowls very much what fruit and vegetables are to human beings, they promote the action of the digestive tract and bowels, reduce the temperature by cooling the blood and generally improve the physical comfort and well-being of the birds.

When fowls and chicks are on restricted range they cannot get green food, and the lack must be supplied if we would have them do their best. It is comparatively easy if we but have the will. If we have a lawn mower the lawn-clippings are most excellent for the purpose; weeds from the garden are greedily eaten, and the trimmings from lettuce, cabbage, beet and other vegetables are good. It is surprising what a quantity of such things the birds will eat if we but supply them, and in eating them they seem to satisfy a craving, and eat less of grain foods. The greens are bulky, and when the birds have eaten a quantity of greens there isn't room for other foods.

Special Crops.

Some poultrymen grow special crops for summer green food for the fowls, such as Dwarf Essex Rape, turnips or beets; turnips and beets may be fed tops and all, but rape leaves should be plucked off and fed, taking those from the bottom of the stalk and leaving the stalk to shoot up and grow more leaves. In many cases the yards of the fowl houses can be used to grow the special green food crops and are the better for it. Where one has duplicate yards one can be sown to a green crop while the fowls are running on and cropping the other, and if the duplicate yards are north of the house the birds will enjoy the shade they find back of the house in summer.

Shade from the broiling heat of the sun is as essential for chicks and

fowls as for human beings, and greatly promotes their comfort; it is unnecessary to state that what promotes comfort aids to growth and profits. Some years ago we visited a duck ranch where shade had been provided by making a shelter of brush cut from the near-by woods and piled upon a framework of scantling and fence rails. It was most interesting to see how quickly the ducklings would hunt the shade after eating and drinking, and their manifest contentment with the comfort found under the shelters was a valuable object lesson. The duck plant on which the crude shelters were noted fifteen to twenty years ago has now grown to be a great duck-growing establishment, and huge low-roofed sheds, two or three hundred feet long by thirty to forty feet wide, are erected for shade and shelter.

One poultryman of our acquaintance puts out temporary shade near the coops scattered over the fields. A light frame work is crudely nailed together, stakes having been driven to support it, and rough boards are lightly nailed (tacked) to the frame; this has a slight incline to the south so that it sheds rain as well as protecting from the sun, and decidedly promotes the comfort of the youngsters. On Go-Well farm, where the young fruit trees have not yet attained a size to be much of a factor, it is the custom to turn the colony houses back to the south, so that all of the interior is shade and a foot or so immediately in front of the house also, and the houses are blocked up so that the chicks can run in and out under them at will. This gives twice as much shaded ground as if the house was left down and, as the air freely circulates through underneath, the conditions are just about right for comfort.

A piece of corn field makes an ideal shade-shelter for growing chicks, a small fruit tract ditto, also sunflowers and artichokes; Prof. Graham of Ontario is a strong advocate of artichokes for shade and says the tubers are a good food for fowls.—A. F. Hunter, in American Poultry Advocate.

CULLING OUT RUNTS.

There are sure to be a few runts in every flock, no matter how hard the breeder may strive to guard against them. Usually these runts may be told from the time the little birds are five weeks old. The tone of the "peep, peep," when they are called for feed and the manner in which they carry themselves when moving around show that they can be nothing but runts when grown up. No matter how hard you try or how much feed you put into them they will be nothing but runts. The feed and time taken to make their growth will be practically wasted, as the birds will never sell for one-tenth of what it cost to raise them.

Usually the best way is to kill them as soon as they show pronounced symptoms of being runts. It may appear cruel, but it is better for the birds and certainly better for the grower. Removing them puts them out of their misery and it insures that the other birds will be healthier. Runts invariably contract every disease which is prevalent and carry them to the healthier birds in the flock. By removing them, you may avoid an outbreak in the flock.—Journal of Agriculture.

Hen Fruit Pays. If you want more, feed

Egg-More

Poultry need to be fed a scientifically balanced ration as much as any other stock. Egg-More is just the thing to mix with good grains to make the same a rightly balanced ration. It is highly nitrogenous, very rich in protein, will keep the hen in good health, sustain her system properly, and enable her to lay lots of eggs when they are scarce and high. Just a little fed daily with good grains, or even with bran, as directed with each package, will do it. It can be fed either dry or as a mash. It contains no cheap filler; the hens like it, they eat it, there is no waste. It makes the cheapest Egg Food especially if you can buy your grains at home cheaper than to ship them in. Many so-called "poultry foods" and "egg-makers" are nothing but stimulants and not advisable to be fed regularly. Egg-More is not a strong tonic and stimulant, but merely contains enough condiments to give the food relish and keep the fowls in fine fettle. It will pay its cost many times over in the increased egg yield. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

AMERICAN POULTRY ASSOCIA- TION BRANCH.

There will be a meeting Tuesday
evening October 8, at 7 p. m. at As-
sembly Hall, Chamber of Commerce
building, 128 S. Broadway, Los An-
geles, for the purpose of organizing
a southern branch of the American
Poultry Association. All interested
in the National organization and in
advancing the poultry interest of
California, are requested to attend
this meeting. Business will be trans-
acted until 8 o'clock, then an inter-
esting program will occupy the bal-
ance of the evening.

SPECIALS AT STATE FAIR.

Following are the special poultry
prizes awarded at the State Fair at
Sacramento last week:

Asiatic Class—Mrs. E. F. Reid,
first; Mrs. F. M. Newbert, second.

American Class—J. D. Canney,
first; T. J. Simpson, second; M. Bas-
sett, third.

Mediterranean Class—Percy Ward,
first; G. S. Meadows, second; M. Bas-
sett, third.

Bantam Class—R. A. Rowan, first;
Geo. Burch, second; Geo. B. Nugent,
third.

Game Class—Percy Ward, first.

Ducks—U. G. Huntley, first; Mrs.
M. E. Plaw, second.

Largest and best display of fowls
in the show—R. A. Rowan, first;
Geo. Burch, second; G. S. Meadows,
third.

Best display any single variety—
Mrs. D. A. Robertson, first; J. D.
Canney, second; R. A. Rowan, third.

CALIFORNIA POULTRY CULTURE.

A practical book containing 180 pages
edited and published by Mrs. Bur-
bridge, has reached our desk. The
book is full of information every
poultryman should know; it contains

Mrs. O. H. Burbridge

illustrations of many of the stand-
ard varieties of poultry, practical and
sensible houses and appliances for
the beginner. The book can be had
for \$1.00 by addressing the author.

Dr. G. O. Smith, Director of the U.
S. Geological Survey, is visiting in
Southern California.

NOTES OF THE FAIR.

The counties did themselves proud
and made a fine display—at least 21
out of a possible 57 did.

Prof W. L. Carlyle who judged all
the stock, is dean of the Agricultural
College in Colorado, located at Fort
Collins. He has an international rep-
utation as a judge of all classes of
live stock and is recognized as an au-
thority on types and breeds.

The stock parade was a great show-
ing and called for applause from the
grand stand.

Guy Miller formerly of Riverside
now of French camp, had some mag-
nificent Jerseys on exhibition.
Amongst his winning were the sweep
stakes in dairy breed, age herd, also
first and second senior champion
cow.

The Howard Cattle Company has
a magnificent string of cattle pre-
sent.

M. Bassett's Percheron stallion
called for most favorable comment
because of his fine form and good
points. The only criticism being
that he was not shown in as good
condition as some others.

J. Crouch & Son whose stock of
Percherons is in charge of Mr. Camp-
bell, is located permanently on the
grounds and made a fine exhibition,
especially in the grand parade of
stock.

The Price Pump Co. had a most
convincing exhibit of their pumps in
action.

Sampson Manufacturing Co. had
regular Niagara of water flow from
one of its monster pumps.

The view over the pavilion from
the galleries was inspiring.

The government exhibit from
Mare Island drew a crowd at all
times. Especially was that the case

Exhibit of Sampson Iron Works
in Machinery Hall

with the wireless telegraph, which
was surrounded at all times by
quivering crowds.

Bean spray pumps were attractive
exhibits and won many compen-
sations.

Murphy's hogs were beauties—
least from a money-making stand-
point.

The Mehling milking machine had
a crowd at its 5 o'clock demon-
stration. Many a farmer turned away
with "By jolly, that's all right."
was in charge of Steiner & Co.

Baker & Hamilton had several ex-
hibits. A fine display of creamery
and dairy goods in the pavilion; also
in the machinery wing an exhibit of
pumps and engines, while the crow
puller was the power milking ma-
chine at the grounds.

Remember the Alamo was there
also. A little engine running a little
dynamo and creating an electric light
exhibit which attracted attention.

J. B. Wagner of Pasadena had his
exhibit of rhubarb, genuine Wagner
rhubarb too, and it attracted attention.

The State University exhibit was
instructive and on education, at least
as to the scope of some of the work
of that institution.

California Horticulturally

CLEAN UP FOR INSECTS.

AS THE summer season approaches its end and the deciduous trees drop their leaves, many of our worst insect foes appear. There is a marked synchism between plant and insect the latter being especially dependent upon the former. When they are awakened from their winter dormancy and put forth their vigorous growth, is the season when insects appear in the greatest numbers, the strength of these destructive forces depends largely upon the vigor of their food supply. Now, when deciduous vegetation is preparing for winter's rest, myriads of insects which winter in the dormant stage, taking refuge in the soil, beneath leaves, in decaying wood and beneath the scaly bark of neglected trees. There is no better preventative against attacks from these pests next season than thorough cleanliness during the late fall and early winter months. And in this case an ounce of prevention is worth several pounds of cure. Every insect which is destroyed, or prevented from issuing in the spring, is also stopped from starting a brood which might amount to hundreds of thousands before the end of the coming summer. Early

FRUIT GROWERS.

One of the features of the coming Fruit Growers' Convention, at Marysville, will be the presence of Governor Gillett who will, unless the unexpected happens to prevent, be present and give a talk in relation to the great and important industry. It may not be generally known, but Governor Gillett is one of the best informed men in the State in matters pertaining to horticulture and has taken a great deal of interest in all matters pertaining to it in the past and understands it thoroughly in the present. The fruit growers may look for a good talk from him at their convention.

...

PEAR BLIGHT STILL WITH US.

In the excitement over the discovery of the White Fly, the pear blight, which has riveted the attention of the orchardists for some years appears to have been forgotten. The pear blight is still with us, but it has been so far brought under control that pear growing may be made profitable. Constant vigilance is necessary and the most careful work for eradication. Those who have taken care of the orchards this year have made big profits, and are very sanguine that they can control the disease.

ANOTHER OUTBREAK OF WHITE FLY.

ANOTHER center of infection of the White Fly pest has been reported. This time from Oroville, and very close to one of the most important of the northern citrus sections. The area in which it was found is not extensive and already measures have been taken to check its spread. It seemed strange, when the White Fly was reported from Marysville and it was stated that it had been there for several years, that it should not have spread outside the boundaries of that city. It is quite probable that colonies will yet be found in other localities and that, in its control, we shall be brought face to face with a serious proposition, as every new area of infestation makes it that much harder to control, and renders eradication more remote. However, the State Horticultural Commission has taken immediate measures to get control of the pest in its new location, and with energetic work we may hope for the best.

Inter plowing will break up the nesting places of swarms and leave them exposed and helpless to the ravages of the elements or the prey of birds. All fallen leaves and rubbish in vineyard and orchard should be gathered up and burned, and these favorite hibernating places be thus destroyed. These measures, backed by judicious and seasonable spraying, will reduce the ravages of insect pests to a minimum.

EARLY SPRAYING FOR PEACH BLIGHT.

While the peach blight has not been so serious during the past season as during the two preceeding years, there is still danger to be apprehended from it, and there is nothing which offers so good a chance for relief as early spraying with Bordeaux mixture of full strength. This should be used in all those sections where this disease showed itself during the past summer. The same treatment is to be recommended for shot-hole fungus of the apricot, which is a disease closely allied to peach blight. Both are fungus diseases, and are spread from spores which are shed on the trees early in the season. These spores take root soon after the first rains, and once firmly rooted are very hard to eradicate; hence the necessity for early spraying.

CALIFORNIA RANKS FIRST.

Both in orchard fruits and grapes, California ranks first of all the States in the Union, and produces 25 per cent of the total value of all such fruits. Of those following next in rank, New York produces about 12 per cent, Pennsylvania 7, Ohio 6 and Michigan 4 per cent. Northern California has the largest acreage in grapes, apples, apricots, cherries, figs, peaches, pears and prunes, while Southern California takes the lead in oranges, lemons, olives, almonds and walnuts.

Of the fifty-seven counties, all but Alpine, Del Norte, Mono, Sierra and Trinity produce fruit of some kind in more or less profusion, although there is a vast difference in the amount of their production; in fact, many counties cannot fairly be classed as fruit growers, having only a few scattered orchards of small proportions.

In addition to the fruits dealt with here, there are others produced on a minor scale, such as blackberries, currants, gooseberries, mulberries, raspberries, strawberries, loganberries, etc., but space will only allow of their being mentioned.—Geo. Robertson, Fresno.

One weed allowed to seed will mean many reinforcements to the weeds.

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

VERY CREDITABLE.

Please find check enclosed to balance my subscription until Dec. 1907. In my estimation you are editing a very creditable paper.—J. J. Adams, Dinuba.

LIKES IT.

Mrs. T. M. Coleman of Buena Park, writes:

I like the paper very much and would not like to do without it.

Southern California and the San Joaquin Valley are becoming better acquainted every day. Many little things show which way the wind blows. For instance, the California Cultivator in its agriculture notes now puts Visalia and Tulare county in Central California. Up to this week we have always been in Northern California, as far as the Cultivator was concerned. The new arrangement is more satisfactory.—Tulare Times.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Pickling Ripe Olives.

Please give me formula for pickling olives?—T. S., Hollywood.

An extended article was given in the Cultivator of May 2 this year, and from it we quote the gist of the information:

The successful production of pickled olives is a matter of experience and depends almost altogether on the individual judgment and skill of the producer. No method can be given which is suitable to all cases, and the best method must be modified according to the nature of the olives to be treated. The following scheme, therefore, is to be considered as a mere outline, to be carefully adapted and modified by the operator at each stage of the process:

1. Place the olives in a solution, composed of two ounces of potash lye to one gallon of water, for four hours. Repeat this once, or twice if necessary to sufficiently remove the tartness.

2. Rinse the olives thoroughly and replace the lye solution with fresh water. Change the water twice a day, until the potash has been removed from the olive, as judged by the taste.

3. Replace the water with brine composed of four ounces of salt to a gallon of water and allowed to stand two days.

4. Put in brine of six ounces of salt to a gallon of water for seven days.

5. Put in brine of ten ounces per gallon for two weeks.

6. Put finally into a brine containing fourteen ounces of salt to the gallon of water.

Inoculation of Vetch.

I wish to sow vetch in the orchard where two years ago we had peas which we inoculated. Last year we had no green crop. Now, must we inoculate the vetch seed this fall and is the same inoculating material used, the same bacteria?—A.L.

If you can get soil from ground where the vetch was grown last year and mix thoroughly a small quantity of it with the seed you will find it sufficient. The inoculation given the pea seed will be of no value to the vetch, but at the same time, the vetch being native here, you will have satisfactory results if you are unable to inoculate at all.

Pear Blight.

I have a Bartlett pear orchard of about 400 trees, and the blight takes toll from them all the time. I keep cutting out the branches that are affected, but every now and then I have to dig up a tree when the disease has got down to the main trunk. In this way I expect to lose from twelve to twenty trees every year.

I propose to replace them with some other variety of pear. Would like to select for this purpose, some kind which is immune to the blight, which is good to mix with the Bartlett for cross fertilizing, and which commands a good market price.

What variety would you recommend me to use?—Alex Craig, Folsom.

We do not know that any pear is immune to blight. It is our opinion there are none. It has been our observation that trees that bear the largest crops do not grow so rapidly

and such trees do not blight so badly. In this way, some varieties get the reputation of being immune, but it is because they are heavy bearers which prevents a rapid growth, which is favorable to the blight. When they are young and making a rank growth, blight is liable to get them. Were we confronted with your conditions, we would plant Bartlett on quince stock. These will commence to bear the second year and will make a dwarf tree, and may not blight. This plan has been recommended by those who make pear blight a study.

Swelling on Hores's Legs.

We have a four-year-old mare that is troubled with swelling of hind legs from ankle to hock. The left fetlock was cut by becoming entangled with a rope and there is a scar. That leg swells most. She was put to hard work soon after breaking and this trouble no doubt comes from strain. When exercised swelling disappears. Your advice as to treatment will be much appreciated. J. B. S., Encinitas.

Ask the druggist for a soap liniment, you do not want a turpentine liniment for that will blister. These troubles are common in young horses and are not serious except when they come from the kidneys. When trouble some we bandage the legs every night with long bandages, three inches wide. If the mare is not in use, turn her out in a corral every day to exercise. Then do not wash her legs with water, this is a common practice that cripples many a good horse with rheumatism. The legs, if wet and muddy when the horse comes in, should be wiped dry with a piece of burlap kept for the purpose, then later brushed to remove any mud.

Ripening Cream.

After churning the usual quantity of cream I received only half the usual quantity of butter. For experiment I churned the buttermilk and received half as much butter as at first and the third time less than on the second. Why does it not all come the first time? Since then several experiments showed similar results.—MRS. J.

This is either improper ripening of the cream or else the churn is full. The cream should be stirred from the bottom and completely mixed every time fresh cream is added. It in the cream jar. No cream should be added later than twelve hours before churning time, except in extremely warm weather. If the cream is ripe for the churn it will be smooth and when a few drops are let fall from the spoon into the can, it will make tiny pits for an instant before spreading out. Taste should be sharp, not rancid. Have the churn not over half full, less is even better. Churn slowly about twenty turns to minute.

Beets for Hogs.

Can hogs be raised for market successfully on a straight beet diet? Can I raise them principally on beets? I could help out with other such things as Kafir corn, sorghum and pumpkins.

Do you know of anyone doing this sort of thing extensively?—J. O. B.

I cannot see any reason why hogs cannot be raised successfully on beets when supplemented with Kafir corn, sorghum and pumpkins. Hogs are fed on the waste of the beet sugar works that, in a measure is often

ANTIOAK LEATHER

Is manufactured by a chemical tanning process, the exclusive property of this company. **It is Superior to any other** and is produced as cheaply as any other leather. The method retains all the desirable qualities of the hide and destroys the undesirable; the result—a perfect leather.

ered. As to whether it would be financial success would depend on w much of the labor you did your- f, how much the interest on the land ount to, and what the price the al market pays for hogs. The al- fa raised hog fed on the waste from a dairy and culls from the vine- rd and orchard is the competitor be met in the larger markets of ifornia.

in Disease.

have eight four-year-old orange es and three of them are beginning gum on the lower part of the unks. What can I do for them?—C. HOLLOWAY, Long Beach.

Paint the diseased part with crude arboric acid diluted one half with ater. After this has soaked in well, rape off the excrescence and paint ain. In the meantime, give the trees od cultivation and loosen the soil o deeply all around the trees, work some stable manure and next spring ve them some complete fertilizer t up for nursery use about two ounds per tree.

egg Grinder.

Please state under queries and re- lies where I may obtain a good feed rinder suitable for different kinds of corn, bones, etc.—J. Smith, Rose- ale, Kern Co.

If a small hand machine suitable or grinding for poultry is wanted, ny of the poultry supply houses ad- ertising in the Cultivator. If a rger or power grinder is wanted, he agricultural implement houses dvertising can fit you out

curl Leaf.

I have some peach trees set out two ears ago last January and they had url leaf last summer and have it ain this year. What can I do for hem and when shall I do it. Sub- riber, Redlands.

Spray with lime, sulphur and salt ust before the blossoms open in the ring. Put in the solution, one ound of bluestone dissolved to each en gallons. This combination will ill the curl leaf and head off the each worm at one operation.

Pruning Fig Trees.

Can a fig tree be pruned and should e cut be painted with anything after rining?—MRS. H. K., Watsonville.

It is often desirable to prune a fig ee. If the cut is over two inches across, paint it with any kind of paint a day or two after pruning.

Stiffness of Mare.

Is there any remedy for a horse that has been allowed to have water while overheated and is stiff from the ef- fects of it? The animal in question, is a mare of good carriage stock. If the stiffness cannot be cured, is she unfit for breeding?—H. B.

If the case is of long standing it is utterly incurable, but will not affect her as a brood mare. It will not be hereditary to offspring.—Dr. Oliver.

HOLSTEIN TRANSFERS.

COWS—Eva of Riverside, Wakalona De Kol 2d and Zwarte 5th, C. N. Whit- more to C. N. Whitmore Co., Ceres.

BULLS—Paul Courtland, Board of Trustees of the Leland Stanford Uni- versity to Wm. Johnston Est., Court- land.

WATER ALL IMPORTANT.

In the interest of health every vil- lage and, if possible, every farm home, should make strenuous effort to have the purest water that is obtainable. A deep well, which is bored through the solid rock, is the surest means of attaining the desired end. Every com- munity should have some people who make a business of boring deep wells, and wherever there is any interest in this question it is wise to communi- cate with the American Well Works, Aurora, Ill.

GENTLEMEN: I want to say for Tuttle's Elixir that it is the best Lin- iment I have ever been able to get hold of both for man and beast. I can swear by it by a practical experi- ence in using the same.

James N. Walters.

SMALL FRUIT PLANTS.

The Fairview Farm Nurseries of Burbank, Los Angeles county, have issued a most attractive little cata- logue of small fruit plants. In it is a fund of valuable information as to planting and care, as well as lists of the most desirable small fruits. A letter to Mr. G. H. Hopkins will get it, if you mention Cultivator.

The Compressed Air Machinery Co., 34-40 Jessie street, San Francisco, are advertising in this paper Olds Gaso- line Distillate Engines for all purposes, anywhere from 2 to 100-horse-power. It is one of the oldest and most reli- able engines on the market, and the company will be pleased to send you prices and circulars on application. Ask them to send you Bulletin No. 15.

Continued from First Page

pounds. The bulls weight from 1000 to 1400. Above all else Jerseys at- tract notice by their large and well- formed udders and prominent milk veins.

The valuable characteristics of the Jersey may be briefly summed up as follows: First, the high percentage of butter fat in her milk; second, the high percentage of total solids in her milk; third, the persistency which she assimilates her food, con- milk; fourth, the thoroughness with which she assimilates er food, con- verting it into high grade milk, with little tendency to lay on in flesh; fifth, the early age at which she reaches the period of utility, about two years, and sixth, her economic production of milk and butter.

In the year 1868 the A. J. C. C. was formed, owing to the need of organi- zation and the establishment of a registration system. At this time the herd book was established. Forty- three breeders constituted the origi- nal organization, and nearly 700 mem- bers have since been elected, includ- ing breeders in every part of this country and Canada. The motto of the club is "The Herd Is the Foun- dation of Wealth."

There has been issued up to the present time 63 volumes of the Herd register of the club and over 280,000 animals have been registered.

A Favorite.

From the standpoint of popularity the Jersey is unquestionably the best known and the most favorably consid- ered of all our dairy breeds. Ex- cluding the Holsteins, they equal if they do not outnumber, all other dairy breeds put together. As a family cow the Jersey stands without a rival. She is a favorite because of her gentle disposition and easy keeping qualities. The milk yields an abundance of rich cream, an attraction not likely over- looked by those of epicurean tastes.

The high adaptability of the Jersey to the various climates and agricul- tural conditions to be met with throughout the world is proved and il- lustrated by the way in which the breed has spread over the American continent, from Alaska to Central America, and from Maine to Califor- nia. Over this vast range of territory, embracing every climate, extreme of

cold, heat, moisture and drought, Jer- sey cattle are kept with profit and bred with success, maintaining their peculiar and valuable characteristics and transmitting them to their off- spring. Large and successful Jersey herds are found in nearly every state in the United States, Canada, Mexico, Cuba and Hawaii.

Success with Jerseys, as with all other live stock, will depend very much on the treatment to which they are subjected, but they require no more than reasonable care, ordinary food and kind treatment. The toning of a cow's nerves with a milk stool in the hands of an angry high temper- ed milker has been found to produce results other than good. The more quiet and unexcited they are kept the greater will be the profits returned.

A BUREAU OF STATISTICS.

George Robertson of Fresno says that the difficulty of obtaining reli- able statistics in this State is de- plorable—indeed, in some cases they are quite impossible to obtain, even in quarters where they should be ac- cessible. A pressing want is a State bureau of statistics, with a statisti- cian in every county, not only to col- lect agricultural and fruit statistics but figures relating to all the many industries regarding which reliable information is so often demanded. At the present time, when this State is making such wonderful progress, applications are constantly being re- ceived by local authorities for infor- mation of this nature, which it is impossible to supply.

For the Farmers' National Con- gress at Oklahoma city in October, Pres. John M. Stahl, of the Farmers' National Congress, is putting the finishing touches on one of the best programs the Congress has ever had. The session will open at Oklahoma city Thursday, October 17, at 9:30 a. m., and the enterprising people of that wide-awake city are making every exertion to render the affair one of exceptional success. The sec- retary is, Geo. M. Whittaker, Wash- ington, D. C.

Beaumont will make large plant- ings of eucalyptus this season.

BILLY MILLER'S CIRCUS SHOW.

At Billy Miller's circus show
In their old stable where it's at—
The boys pays twenty pins to go,
An' gits their money's worth at that!
'Cause Billy he can climb and chalk
His stockin'-feet an' purt' nigh walk
A tight-rope—yes, an' ef he fall
He'll ketch, an' "skina cat"—at's all!

He ain't afraid to swing and hang
First by his legs!—an' maybe stop
An' yell "Look out!" an' nen—
k-spang!—
He'll let loose, upside down, an' drop
Wite his hands! An' nen he'll do
"Contortion acts" ist limber through
As "Injarubber Mens" at goes
With shore-fer-certain circus shows!

At Billy Miller's circus show
He's got a circus ring—an' they's
A dressin'-room,—so he can go
An' dress an' paint up when he plays
He's somepin' else;—'cause some-
times he's
"Ringmaster"—bossin' like he
please—
An' sometimes "Ephalunt"—er "Bare-
Back Rider," prancin' out o' there!

An' sometimes—an' the best of all!—
He's "The Old Clown," an' got on
clo'es
All striped—an' white hat, all tall
An' peakud—like in shore 'nuff
shows—
An' got three cornered red marks, too,
On his white cheeks—like all clowns
do!
An' you'd ist die, the way he sings
An' dances an' says funny things!
—James Whitcomb Riley.

THE SPIRIT OF REVOLT.

MYRA counted the little pile of
bills the second time, then she
rolled them up and put them
back in the tin baking-powder box.

"A hundred and fifty-four dollars,"
she said, as she put the cover on. She
rested her elbows and looked wearily
out of the window. "You might go
this afternoon and put it in the
bank."

Ruth, her younger sister, sat in the
rocking chair beside the stove. Al-
though the October sun shone in at
the west windows, there was a cold
wind blowing, and the warmth of the
fire was very comforting.

Suddenly Ruth spoke passionately.
"I'm tired of being poor, and I'm sick
to death of the way we live."

"So am I," said Myra, without
changing her position or her expres-
sion.

"We never go anywhere, nor see
anything, nor hear anything."

"Or know anything," Myra said
dully.

"It's all very well in the summer,"
said Ruth. "It's fun to see things
growing—the flowers and vegetables
—and to have folks come and buy
them. We work hard, but that's kind
of fun, too, while it lasts. But we
don't have any other kind of fun, and
I'm tired of it."

"So am I," Myra repeated.

"When the fall comes we count up
our summer's savings and put them
in the bank, and that's the end of
everything till the next spring.
Through the winter we just stag-
nate."

"Vegetate," said Myra.

"If only we could hibernate it
would be some satisfaction, but we
can't," and Ruth fell silent again
brooding discontent and rebellion in
her eyes. Presently she spoke again.
"Lots and lots of folks who don't
work half as hard as we do have—
everything. They don't earn it, and
we do. We work hard enough to
have everything we want, and I say
we are fools if we don't take what we

want. It's our right. I don't care
what folks say. We've tried being
poor and honest long enough and
have seen the folly of it. Let's try
the other way for a while."

Myra turned in her chair and
looked at her sister. "But how?"
she asked.

Ruth's eyes flashed and she spoke
vehemently. "Sell the farm and then
go to the city and hire a big house
and furnish it elegantly; entertain,
go to concerts, opera, theater, lec-
tures, and enjoy ourselves generally."

"How could we pay for it?"

Ruth laughed recklessly. "Don't
pay for it," she said. "Pay for the
theater tickets and things like that,
but not for the necessities of life—
house rent, food, fuel, lighting. I'm
tired to death of paying for the nec-
essaries of life."

"So am I," said Myra.

"Let's do it, then."

But Myra was more cautious. "We
might want to come back to the
farm," she said. "Let's take this
money and go to the city and stay as
long as we can, and then come back
home."

"That's so," agreed Ruth, "let's.
Won't it be fun to buy house furnish-
ings on installments?"

"And the grocer," said Myra.

"And the coal man," said Ruth.

"And we won't do a stroke of work
from morning till night."

"No, we won't."

Both fell silent, making plans.
Their faces were lighted up by new
hope, and they smiled at each other
happily.

"I don't see why we can't go by the
first of November—all the fall work
is done," said Myra. Then a sud-
den shade of consternation crossed
her face. "But what shall we do
with the house and the cow and the
horse?"

"Oh, dear! I had not thought of
that." They looked at each other in
alarm for some minutes.

"Oh, I have it!" cried Ruth. She
jumped up and walked excitedly
about the room. "Old Mr. and Mrs.
Kelsey would be tickled to death to
come here and keep house for us.
You know they are perfectly miser-
able at the poor-farm."

"Yes, that's so, and we've got
stocked up with provisions and vege-
tables, so it wouldn't cost them
hardly anything to live."

"Why, they'd sell milk at the door,
as we do, and that would almost
keep them supplied with things
they'd have to buy, that and the
eggs."

"So it would."

A little later the sisters had gone
to the city, and the old couple from
the poor-farm were comfortably set-
tled, perfectly happy in their new in-
dependence and quiet solitude.

As for Ruth and Myra, the large
house of their dreams had been re-
duced to three pleasant rooms and a
tiny pantry.

"It's really all we need," said My-
ra.

"Yes," acquiesced Ruth. "We can't
afford to keep servants, and we
don't want any more rooms to care
of."

"And I think we'd better pay one
month's rent in advance," said My-
ra. "We won't have to worry about
that item, then."

"No, said Ruth, craftily, "and
will be easier to get out of payin'
the next month's rent."

They furnished their rooms dain-
ily and simply and made their fir-
payment on the things. The room
were not heated, but they had
large kitchen range which warmed
them sufficiently with the aid of
little oil heater in extreme cold
weather. There being a family
the tentment below, the floors we-
not cold.

And now they began to take con-
fort. Every evening saw them at
concert, a lecture or the theater.
The entertaining had not begun.
Ruth had bought a chafing dish
anticipation of the little parties
would give, but she had not used
except to practice upon. Somehow
they did not seem to find congenial
friends, as they had expected.

The first month passed thus. When
the second had opened with the fun
in the baking-powder box alarm-
ingly low, the sisters began to be
trifle apprehensive. They took
going out separately in the daytim.

One day Ruth came bounding
the stairs and burst into the kit-
en, her face wreathed in smiles. My-
ra stood there smiling also, and her
face very red from working over the
hot stove.

"I've got work," said Ruth joyous-
ly.

"So have I," said Myra.

"I'm going to work in a flower
store. I showed the man what
could do this afternoon, and he
praised my work and told me
come tomorrow for a steady job."

"And I'm going to cook for
woman's exchange," said Myra.
carried some things there day before
yesterday, and they sent me an-
der today, and they think I'll have
all the work I want to do."

After this the sisters went on
evenings less than they had done.
They worked steadily and were con-
tented. Ruth made some friends
the flower store, and the chafing dish
came into use at last.

As they grew more accustomed
their work they fell into the way
going to a play in the middle of the
week, a concert Saturday night
to church on Sunday. The last
February came, and for some time
the sisters had been subject
attacks of melancholy. One evening
they sat together resting after
hard day's work. Ruth was the first
to speak. "I don't know what's the
matter with you, but I am as ho-
sick as death."

"So am I," said Myra.

"I want to get back to the farm."

"So do I."

"I don't think much of this way
living. I'd rather be poor but ho-
est."

"I know I would," said Myra.
Then, with unusual vehemence,
"hate debt."

"So do I," said Ruth. "And I
stallments aren't the least bit of fun."

"No, they are not."

"I wonder how much we owe.
Let's reckon it up and know the
worst. It's hung over me like
nightmare all winter."

"It has over me, too. If I hadn't
been so busy I'd have gone crazy.
It's awful."

"I know it," said Ruth. "It was
lucky we could get work. But
want to get back home. Poverty and
honesty for me, every time."

"My sentiments, too," said Myra.

"Well, let's take the fatal plunge. How much do we owe? Will we have to mortgage the farm to pay?"

"I don't know. I guess not. The furniture is what worries me most," said Myra's brow became furrowed with lines of care.

"Oh, that's all right," said Ruth sily. I made the last payment on at two weeks ago."

"You—" Myra gasped.

"Why, you see, the things are pretty, and I thought they'd come in handy at the farm—we need new furniture there—and so I went and made a payment every week, after I got work. That hasn't troubled me at all, but I have lain awake nights worrying about the groceries."

"Why," said Myra, "ever since I began to cook for the exchange I've paid for all the groceries and paid up the back bill, too. It doesn't cost us much to live, you know. And I've paid for the coal and the kerosene besides."

"Why—why, then we don't owe anything!" Ruth cried incredulously, "or we've paid the house rent together."

"And we've had all our worry for nothing."

"I wish I'd told you."

"I wish I'd told you."

There was a little silence.

"Just the same, I want to get back home," said Myra.

"So do I. And we'd better, too, for the most time to be thinking about getting in our sweet peas."

"And the green peas, too."

Two weeks later they were on the train going home.

"After all," said Ruth reminiscent—"it was considerable fun."

"Yes," said Myra, "but another time I'd go in for honesty and pay out bills from the start."

"Yes, so would I."

"I suppose we could get back our work any time."

"I'm sure of it."

"Didn't we go to lots of plays and hear lots of music?"

"Yes, and we didn't stagnate, did we?"

"Not exactly."

"Let's try it again next winter."

"Let's."—Susan Brown Robbins, in the Rural New Yorker.

IT IS WELL TO KNOW.

That a spoonful of mustard in a gallon of water will kill insects in the earth? This is good for potted plants.

That two potatoes grated in a basin of water will give better results than soap in washing delicate flannels and linen goods, ribbons, etc.?

That you can remove the odor of fish paint from a room by leaving there a pail of water into which several onions have been sliced?

That a crack in the stove may be patched by filling with wood ashes and salt moistened just enough to work well. Smooth down neatly and cover with blacking and it will prove not only durable, but more sightly, as well as more safe than before.

That if an apple or orange is placed in a box of fresh cookies it will impart to them a most delicious flavor? A cut apple put in the cake box will keep the cake fresh a long time.

The Manila street cars carried 20,000 children free on the Fourth of July.

Before the days of coin, the Greeks used copper nails as money.

Coulson's No. 3

Condition Powder For POULTRY

If you are not already using COULSON'S NO. 3 CONDITION POWDER, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season. If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

WE CLAIM COULSON'S No. 3 Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in. We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are beginning to molt heavily, their combs are as bright and red as at the beginning of the season. You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably. Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want. Where the local dealer does not keep it, we will make you a SPECIAL OFFER to deliver it freight prepaid to any Railroad Station in California, at the following prices:

10-lb Package, \$1.50; 25-lb Package \$3.25;
50-lb Package, \$6; 100-lb Package, \$11.

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

GET SOME NOW AND INSURE YOURSELF
LOTS OF EGGS WHEN PRICES ARE HIGH.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Cal., Sept. 25, 1907.

Butter.

The butter market is claimed to be weak in spite of the fact that reports from the north indicate the firmest of conditions there. Quotations, however, are higher than last week by about 5 cents per roll on better grades.

Creamery extra per roll... 65@67
Creamery first... 60
Dairy... 48
Cooking... 45@47
Eastern... 55@57½

Cheese.

Cal. Young America, per lb... 19
Hand... 20
California Anchor... 18
Northern fresh... 17@17½
Eastern... 17½@18
Imported Swiss... 32
Tulare flats... 18
Domestic Swiss... 21@22

Eggs and Poultry.

Eggs have taken a slight advance during the week, and are now quoted at 37 cents for candled, and it is reported that all dealers are holding up to quotations.

Eggs local candled... 37
Eggs case count... 35
Fresh Eastern... 27
Eastern storage... 26

Market on poultry is in excellent condition, and selling up to full quotations. There is no glut whatever, in the market, and all stock is well cleaned up.

Hens per lb... 14
Young roosters per lb... 14

Rolled barley per ton... 30.00
Kaffir Corn... 1.65

Pomona Times appeals for judgment to be shown in estimating profits in orange growing because of the fact of last year being exceedingly profitable to the orange grower, is no indication that these profits will continue over a period of many years. The claim made is that these profits will affect the tariff arguments before Congress.

San Bernardino county fruit exchange reports the value of its citrus output for the past year as nearly \$1,000,000. This netted to the grower, above freight and shipping expenses, \$647,000 or an average of \$1.80 per box.

Under the impetus given to irrigation by controlling the Colorado river, the irrigable lands of Imperial valley are increasing.

Vegetables.

Supplies of vegetables were slow to arrive and small in quantity yesterday. A general cleanup on Saturday in the market firm and yesterday's small receipts enabled dealers to hold what they had in hand at ruling figure. Monday is always noted for its small consignments and moderate demand and yesterday was no exception. Today supplies will pour in and doubtless weaken the market again.

Onions are in heavy supply, with poor inquiry and a weakened market. Cucumbers are in moderately heavy receipt, but the call for them has slackened materially. Green peppers are accumulating again and squash is active.

Fresh Fruits.

The usual dullness attending Monday prevailed and even considerable Saturday's carry-over remains for today. Dealers seemed determined to recover the firm tone lost in Saturday's weak market, but buyers were slow to make offers at anything like ruling figures. Nutmeg melons were small, some green and some overripe. Buyers refused to take them, except in very small way. Grapes were in moderate supply and dealers occasionally obtained better figures than Saturday. Varieties of pears are confined chiefly to the Oregon kind at these are mostly green. Plums are in little supply. Rhubarb is coming slowly again, but meets with no inquiry.

Remember that the horse needs a
bath as frequently as its master. The
last two years the writer was on the
farm, he bathed the sweat from the
horses every evening after they had
cooled off. He never had more
healthy animals. It only takes a
few minutes, but it pays large profits.

The horse gets the most good from
its feed by eating slowly. If the ani-
mal is a glutton and cannot be made
to eat slowly in any other way, place
several links of a log chain in
the bottom of the feed trough and
pour the oats in over this. The ani-
mal will have to spend a great deal
of time getting the oats from around
the links.

Tustin claims to have over fourteen
thousand acres planted to beans.

EFFECT OF MOISTURE ON WOOD.

The effect of water in softening or-
ganic tissue, as in wetting a piece of
paper or a sponge, is well known, and
so is the stiffening effect of drying.
The same law applies to wood. By
different methods of seasoning two
pieces of the same stick may be given
very different degrees of strength.

Wood in its green state contains
moisture in the pores of the cells,
like honey in a comb, and also in the
substance of the cell walls. As sea-
soning begins, the moisture in the
pores is first evaporated. This less-
ens the weight of the wood, but does
not affect its strength. It is not until
the moisture in the substance of the
cell walls is drawn upon that the
strength of the wood begins to in-
crease. Scientifically, this point is
known as the "fiber-saturation
point." From this condition to that
of absolute dryness the gain in the
strength of wood is somewhat re-
markable. In the case of spruce the
strength is multiplied four times; in-
deed, spruce in small sizes, thorough-
ly dried in an oven, is as strong,
weight for weight, as steel. Even
after the re-absorption of moisture,
when the wood is again exposed to
the air the strength of the stick is
still from 50 to 150 per cent greater
than when it was green. When, in
drying, the fiber-saturation point is
passed, the strength of the wood in-
creases as drying progresses in ac-
cordance with a definite law, and this
law can be used to calculate from the
strength of a stick at one degree of
moisture what its strength will be at
any other degree.

Manufacturers, engineers and build-
ers need to know not only the
strength but weakness of the mater-
ials they use, and for this reason
they are quite as much interested in
knowing how timbers are affected by
moisture as they are in knowing how
they are weakened by knots, checks,
cross-grain and other defects. It is

obvious that wheretimbers are cer-
tain to be weakened by excessive
moisture they will have to be used in
larger sizes, for safety. So far, en-
gineers of timber tests, while showing
that small pieces gained greatly in
strength, do not advise counting on
the same results in the seasoning of
large timbers, owing to the fact that
the large timbers usually found in the
market have defects which are sure
to counterbalance the gain from sea-
soning.

The Forest Service has just issued
a publication entitled "The Strength
of Wood as Influenced by Moisture,"
in which are shown the strength of
representative woods in all the de-
grees of moisture from the green
state to absolute dryness and the ef-
fects of resoaking. This publication
will be sent free upon application to
the Forest Service, U. S. Department
of Agriculture, Washington, D. C.

ONE OF THE BEST EVER.

When a resident of Ohio I thought
I couldn't do without Farm and Fire-
side, but here the Cultivator is much
better adapted to one's needs, and I
can say that I consider it one of the
best agricultural papers I have ever
read, and I herewith enclose \$1. for
its continuance. H. D. WILLIAMS,
Woodbridge.

One Million Dollars Every Day

FROM the annual report of the State Board of Trade for 1906, issued last month, something of California's vast earning power is made apparent. Statistics in this exceedingly valuable report as they pertain to our industries, give some idea of the possibilities of the State from an agricultural standpoint.

Probably the one industry which has given the State more prominence commercially than any other, is the citrus industry and decidedly so, for the volume of its shipments in tons far exceeds that of any other commodity produced by the State. The report shows that in 1906 California shipped 381,901 tons, or 38,190 carloads of citrus fruits. Green deciduous fruits follow next with 108,924 tons, or 10,892 carloads. Dried deciduous fruits are a close second to green deciduous fruits with 108,441 tons, or 10,844 carloads.

The deductions made in citrus shipments as shown in the report doubtless come from taking 10 tons as a car load basis, instead of 13 required by the railroads, and also includes local shipments not reported by the railroads. But the total shipments of citrus fruits as tabulated by the California Fruit Exchange for 1906 were 578 car loads from Southern California, with an approximate of 100 cars from the north.

Of wine we sold 6191 carloads and raisins, 4070 carloads; brandy, 37 carloads and nuts, 499 carloads. Canned fruits, 6461 carloads. Green vegetables, 8259 carloads and canned vegetables, 722 carloads.

We consume annually of prunes in the United States 100,000,000 pounds, or an average of 1.15 pounds to every man, woman and child in the country.

Of butter we produced in 1906, 44,044,578 pounds. The gain of 5,213,138 pounds in 1905 over 1904 and of 2,083,531 pounds in 1906 over 1905, places California well to the front as a dairy State. We

produce six times as much butter as is produced in Oregon. With but few exceptions, all the counties show increased production.

The State's record in cheese production is not so good as in butter, being from 6,399,625 pounds in 1897, to 6,418,480 pounds in 1906, with several smaller yearly productions during the nine years.

The gain made in farm animals both in numbers and value has been exceedingly gratifying. This gain shows an increase of \$11,000,000 more than in 1905 and \$19,000,000 more than in 1904. In wool the State has shown relative growth since 1902, when we produced 21,000,000. Since that we have increased to 24,000,000 pounds.

Farm crops generally show remarkable gain annually, according to the figures given California's wheat crop which was 157,045 tons less in 1905 than in 1904, but in 1906 the crop is about the same as in 1904.

The hay crop of California is one of the State's most valuable products and an indispensable adjunct to other industries. It consists of grass hay, grain hay and alfalfa.

The 1905 crop was 2,998,873 tons of grass and grain hay, and 1,808,441 tons of alfalfa, the total value being \$31,795,515.

We produced of hops in 1906, 20,000,000 pounds, an enormous gain in 1906 over 1905, of 6,863,000 pounds. Of lumber we produced and sold 544,013,798 feet in 1906. In minerals we mined in 1905, \$43,069,227, making a steady gain each year (except in 1904) for ten consecutive years. The gold produced is nearly \$20,000,000 a year and the petroleum crop is worth nearly \$10,000,000 a year, and is increasing in value.

These several items when segregated and computed bring the earning capacity of California up to \$1,000,000 a day. With such capability and with constantly expanding conditions, we may look the future in the face with a feeling of confidence and reliance.

The Mediterranean Fruit Fly

The Pest Sometimes Called Australian Fruit Fly, the Most Destructive Which the Fruit Grower Has Ever Faced and Which He Is Almost Helpless in Combatting

MAY California never experience the fruit fly. May her present experience with the white fly be such that public interest may be aroused until such vigilance shall prevail that no importation of that pest may be made. It would probably be the death of our greatest industry.

The Department of Agriculture of Victoria in its Journal publishes some facts regarding this pest which we quote in order to enable our growers to grasp the situation which would face should the pest gain entrance.

This terrible scourge of the fruitgrower is becoming but too familiar in Victoria, the larvae having been found in peaches, pears, quinces, apricots, plums, nectarines, guavas, oranges, lemons, apples, citrons, loquats, mangoes, pumpkins, bananas, tomatoes, pineapples, and persimmons; so that it will easily be seen that hardly any fruit can be said to be exempt from its attacks, and all of the fruitgrowers' enemies the fruit fly is undoubtedly the worst.

As this article is written especially for the grower, technical terms and descriptions are avoided where at all possible, so that the plate drawn from the original will be more easily understood. Unfortunately for Victoria, we are now having a very practical experience of this pest. Numerous cases have occurred, so far most of them in private gardens in the northern districts of our State. The danger has, we hope, been grappled with, and the pest, at least partially, stamped out by the adoption of drastic measures.

One great danger lies in the fact that many well-meaning persons suppose, or profess to suppose, that fruit flies will neither live nor thrive in Victoria. This is a most mischievous, as well as dangerous theory, as the writer knows from personal experience that in Victoria the larvae and the flies will live for weeks exposed to the sun by day and night, during both summer and winter and, as showing the vitality of the larvae, some have been kept by Mr. Fuller, Government Entomologist of Natal, for over three weeks in a freezing chamber, and at the expiration of this time, the perfect insects have been reared. It can be hoped that none but the most careful will attempt to rear these flies artificially, for should this be obtained a footing, which is extremely probable, the fruitgrower will have to pack up and be on his way, at present, no known remedy of nature may provide, in the shape of some parasite, a means by which the fly may be kept in check, if not stamped out altogether!

In writing of the above insect, Mr. Froggatt, Government Entomologist of New South Wales, in a paper, with Mr. Tryon, of Queensland, has had considerable opportunities of watching fruit flies in the orchards and elsewhere, remarks that this fly is not a modern importation, as it was not until 1886 that it was discovered in orchards near Perth in Western Australia, and shortly after this Mr. Froggatt found them flying about in the breeding jars from peaches supposed to be infected with the Queensland Fruit Fly (*Dacus tryoni*) which had been obtained at the Sidney Fruit Markets. Mr. Froggatt further remarks in his valuable treatise Notes on Fruit Maggot Fly, that although previously unknown in the Colonies it had a well-known record in Europe as far back as 1826, when it was described by Wiedmann as an orange pest, under the name of *Citripedra cap-*

itata; and a few years after by Macleay, who published a large colored plate of the perfect insect. In this paper he, Mr. Macleay, stated that fully one-third of the oranges shipped to London from the Azores were rendered unfit for use before reaching their destination through the presence of this maggot when they were packed.

"Early in 1890, an article appeared in a publication known as *Insect Life* where the fly was described and figured as a peach pest in the Bermudas. It was said to attack green and half-ripe peaches and mandarins most, and one correspondent reported that the larger oranges were not attacked.

"In 1892 J. H. Cook gave an account of the Orange Fruit Fly in Malta. He stated that the

known to us in Victoria as the West Australian Fruit Fly: "The eggs are laid in the fruit by the female fly, and the larvae are soon hatched from them and commence feeding. When they are full grown the maggots leave the fruit and enter the soil to pupate, that is to change into the last stage prior to their emergence from the soil as perfect insects, and great numbers are carried to the ground by the falling fruit. After having rested in the soil as pupae for about twelve days the flies hatch and make their way to the surface and continue their destructive work."

The following is an account of some experiments, dealing with the Mediterranean fly, which were carried out by the Assistant Entomologist (Mr. C. French, jun.) and myself during 1896. The results of similar experiments made by Inspector Farrell at my request are also given.

The larvae of this fly were found in bananas imported from Queensland on the 14th August, and on being placed in the breeding jars pupated on the 20th August; the perfect insects emerged on the 4th October and lived for several weeks, water, with a little sugar added, being the food placed at their disposal. Larvae were detected in oranges from Maryborough (Queensland) on the 19th September, and pupated on the 24th September; the perfect insects commenced to emerge on the 26th October, and continued emerging till the 30th. On the 2nd November several cases of Seville oranges were sent from Sydney. These were badly infested with larvae of the Mediterranean fruit fly; on being placed in the breeding jars they pupated on the 6th November, and the perfect insects were hatched out on the third of December. Not less than 60 flies were hatched from two Seville oranges and the perfect flies lived ten days without food. The Mediterranean fly has also been reared from tomatoes sent from Queensland. The larvae of the fly curl up and by a muscular movement jump fully one foot. I placed various fruits with these flies, but could not get them to deposit eggs in them.

These flies are very active at night if exposed to light, and possibly might be attracted by placing a lamp among the trees, the lamps to be placed in kerosene.

Inspector Farrell reports the results of his investigations in connection with the Mediterranean fruit fly and its habits as follows: "I placed fully-grown larvae in a jar on the 12th February. Flies hatched out on the 25th, i.e., thirteen days later. These were placed in a tin box containing some earth and covered over with a mosquito curtain; sliced tomatoes and peaches were put in with them, and the box was left out in the open air. Flies fed on the tomatoes, but punctured peaches and deposited eggs in them. The flies died on the 21st March, twenty-five days old. Other flies which were hatched out on the same day but got no food, died on the 1st March, four days old. I reared from the peaches a number of larvae which went into the chrysalis state on the 15th March, and I expect them out on the 30th or 31st March,

On the 15th March I saw a fly on a peach. The fly must have just laid. I secured the peach and kept it under observation. At first there was no puncture visible, but afterwards one became pronounced. I reared five larvae from this peach;

Concluded on Page 324

The Mediterranean Fruit Fly

3. The pupa case of the fly. 4. The Mediterranean fruit fly, enlarged.
5. The Mediterranean fruit fly, natural size.

whole of the oranges had been destroyed during the last two years by this maggot, and that a Commission had been appointed by the Governor to report on the best means of checking this pest. In the following year a pamphlet was published in the Mediterranean Naturalist by Professor N. Tagliferro at the expense of the Agricultural Society of Malta to give the orange growers a popular account of the fly. He advised them to "smear a few oranges on each tree with honey, so that adult fly would, in gathering around them, be caught and destroyed."

In Malta, as has already been stated, we are informed that the Mediterranean fly does great damage to the orange crops, and its attacks appear to be confined to oranges only.

Some trees are netted to protect the fruit from these flies. But unless fruit is much more valuable than it is at present in New South Wales, it would not pay to treat the trees in this manner, as he says it costs about 3s. per tree to protect them by this process from the flies.

Mr. Fuller, formerly an Australian, but now Government Entomologist of Natal, gives the following account of the habits of this insect, as observed by him, and which was for some time

Deciduous Fruit Culture

ADAPTION OF VARIETIES TO SOILS.

THE Yellow Newton Pippin apple, which is well known to most apple growers well illustrates the adaptation of varieties to soil. This variety originated on Long Island and was grown in a few restricted localities in the vicinity of New York, and in a small way at Albemarle in Virginia. In the first year of Queen Victoria's reign, Her Majesty was presented with a few barrels of this variety, which were grown at Albemarle. So pleased was she with the apples that she had the tax removed from this one variety. As might be expected, this notice by the Queen brought the variety into prominence, and since that time it has been much in demand for the export trade. This demand led to increased plantings, when it was soon found that this variety succeeded in only a few restricted localities. Recently it has been determined that this varietal peculiarity is entirely due to soil. Wherever soil is found which corresponds in its physical make-up with those where the variety has succeeded, and the climatic conditions are favorable, the Yellow Newtown will succeed.

It is simply an extreme case of the adaptation of a variety to a peculiar soil. No doubt some other factors, which are not now understood, enter into the adaptation, but the general principle holds good.

Likewise Potatoes.

We find that potatoes will only succeed well in soils of a certain character. Potato soil must not be too heavy and should contain a certain per cent of sand or small gravel; and what is equally important, such soil must be well under-drained. It will be found, as a rule, that in localities where potatoes are successfully grown, drainage is provided for by a bed of gravel which underlies the surface at varying depths.

It has been found at the Colorado Agricultural College that the cause of this adaptation of the potato plant to soils of the same general character is due to the fact that certain plant diseases do not find in them conditions for growth.

As to Raspberries.

The Marlboro red raspberry is another striking example. At its home on the Hudson river it makes a weak, spindling growth, and seems to be gradually deteriorating. No variety has made the growers of that region more money, but it is now being abandoned for more vigorous kinds. In the famous raspberry district of Loveland, Colo., it is surprising to find that the Marlboro is practically the only variety grown for market, and that the conditions there are such that the plants are extremely vigorous, often attaining a height of ten feet. An examination of the soils and the behavior of plants points pretty strongly to the conclusion that the Marlboro raspberry is nearly as particular in regard to soils as the potato. It certainly succeeds best in soil which is similar to potato soil, and evidently for similar reasons. Most growers are familiar with "raspberry yellows," where the foliage on fruiting canes becomes curled and gradually takes on a yellow color. Not infrequently the fruit on such canes shrivels before it ripens. Upon

examination, the outer bark of the main root of such plants will be found to be much discolored, and often the stem will be constricted just below the surface of the ground. There is little doubt that this is the work of fungi, as is the case with the potato, and consequently, in order to be successful with this crop, much attention should be given to the character of the soil.

The intending planter of fruit of any description will do well to study very thoroughly the plantations in his neighborhood which are located on similar sites and soils.—W. Pad-dock.

PRUNING TREES WHEN SETTING.

A writer in Farm Progress in giving information as to tree planting says: "As the visible manifestation of all plant growth of the ordinary kinds is above ground, it results that the common impression is that the most important part of the plant for its perpetuation is the part above ground. But in most cases this is not true.

"The fundamental cause of the growth, because it gathers the food supply, is the root system. The result of this is as a general rule that in a well-rooted tree or plant, though the entire tree itself is cut off at the ground, the life left in the roots will send up new growth.

"This being true, it is a good plan to trim the tops of young fruit trees pretty vigorously when transplanted, so that it will not make great demands on the root system, and also to trim the roots too. How much to prune the roots is a question that is not fully determined. The general practice with most orchard growers is to cut off all broken roots smooth and to head in the long straggling ones. And if there is a large number of fine roots it is advisable to thin them out. The roots to be trimmed, and the top to be trimmed moderately. The best practice is to cut off the top so as to cause the trees to head low.

"There is a vast difference in the profit of handling fruit from orchards of low-headed trees and those that stand up very high. Some fruit growers undertake to keep all their trees so low that in gathering the fruit there will be no necessity for the use of ladders.

"I think the general impression among the inexperienced is that it is best to plant large trees, two and three years old. But such is not really the case. One year old trees are recommended by most fruit growers, because, having made a few branches, it is possible to prune so as to make a better permanent shape. If cut back to eighteen inches or two feet, the yearling tree will make its top all new. But older trees have made quite a number of branches already, and the permanent head cannot be made so low or so well shaped. The best results seem to come from well-grown yearling trees cut down to a mere stick."

GOOD PROFITS IN PECANS.

The pecan groves of Texas are greater bonanzas than Nevada gold mines. Orchards have produced \$5000 worth of commercial nuts in one season per acre. Individual trees yield \$150 worth of nuts, and the tree increases in productivity until it is seventy-five years old.

California Horticulturally

TOKAY IS KING.

THE scepter of the fruit kingdom in California has passed through several hands in her history, and various fruits have come to the fore to claim it. The last aspirant is the Tokay grape, and from results obtained during the past five years, it is entitled to the honor. There has probably been more money taken from the Tokay grape vineyards of Northern and Central California during the past few years than from any other fruit lands in the State. Last year was counted the banner year, this season has surpassed it. The shipments have been heavier, prices better and profits larger than ever before known. The man who has a few acres of Tokays in the Tokay section is a fortunate individual, as things are going. One car load, shipped through the Producers' Fruit Co., returned \$2558. Lodi, which is the center of the Tokay section is one of the most prosperous towns in the State, and the people of that town recognizing their indebtedness to this fruit, recently held a Tokay Carnival, which all the surrounding country participated. A popular young lady has been chosen a Queen Tokay, and many of the State officers, including the Governor, took part in the proceedings. The Tokay, to give the best results in size, color and flavor, requires peculiar soil and climatic conditions, and these are furnished in its perfection in the rich alluvial lands of San Joaquin and Sacramento counties. The bunches are extraordinarily large, as are the individual berries, and the color a deep translucent, which makes them especially attractive to the eye, and they are a favorite to the Eastern consumer on their own merits.

IRRIGATION AND CULTIVATION.

Thirty years ago there were two great questions before the fruit growers of the State, and these were, whether high or low pruning were better and whether it were not better to cultivate more and irrigate less. The former question has been definitely settled in favor of low pruning, and in Southern California where water is valuable, it has been covered that a little water will go a long way, provided it is properly conserved, and give much better results than where too much water is used. This is a truth which many farmers in the northern part of the State have yet to learn. Water is abundant there, and it is used in many cases with destructive wastefulness. Best results are obtained with a minimum allowance of water, provided that such water is not allowed to evaporate through capillary action or to be pumped out of the soil by a growth of weeds whose masses of roots are constantly robbing the soil of both moisture and fertility. Many farmers believe that it is much easier to irrigate than to cultivate, and they drown out their land, irrigate both trees and weeds at the same time, and the latter usually get the greater advantage from their irrigation.

ICE GROWING IN CALIFORNIA.

One of the most attractive exhibits at the late Irrigation Congress was made by Texas of rice in all stages of preparation. The rice was grown in the straw, threshed, hulled

and cleaned ready for market. Several varieties were shown, and the display attracted much attention and elicited many inquiries as to the methods of cultivation. Several attempts have been made by our university people to grow rice in California, but with no practical results, but this season Mr. Hinshaw of the California Land Co. has some thirty-five acres on the Sacramento river, in Glenn county, which is now nearly ready to harvest. So far the experiment is a pronounced success, and if, after harvest, it fulfills its present promises, rice growing will become an industry with the farmers of the Sacramento valley, who are watching the experiment keenly.

HORTICULTURISTS vs. BIRDS.

The writer does not believe Audubon ever ran a fruit ranch or tried to raise sunflowers, or, for that matter, anything which under any conceivable pretext a bird could find time to destroy or could make available for any purpose. That is in California, at least.

No one can be more in sympathy with anything that wears feathers, from a humming bird to an ostrich, than the writer, yet when he sees his fine strawberry patch, his sunflowers and his peach and fig trees stripped of every desirable bit of fruit, it causes a feeling akin to retaliation to rise in his bosom.

Seriously, there are several varieties of the feathered denizens of our fields that are protected by law that the writer questions, being exactly the agriculturists' friends. The plain attired, but sweet-voiced mocking bird between songs can find time for the consumption of more of the choicest production of the agriculturist's fruit orchard or berry patch than is hardly conceivable from their small dimensions each mocking bird is good for a 10-pound box of cherries, a crate of strawberries and a liberal number of figs and peaches thrown in during the season; if there is anything else in sight worthy of his attention he is Johnnie on the spot.

The diminutive linnet and a flock of about one or two hundred black-birds can accomplish some thing in the way of destruction.

In the writer's opinion this question of how to stay the ravages to our crops and fruit gardens by birds is becoming a serious one.

Aside from his own troubles, numerous complaints have been voiced in the hearing of the writer lately hardly complimentary to the societies protecting these vicious little thieves so perfectly. The scarcity of bugs and insects at the fruiting season unquestionably favors their destructive tendencies directed so assiduously against the profits of the agriculturist.

To those who suffer most it is hard to believe that their usefulness is in excess of their destructive ability. The wholesale and indiscriminate destruction of birds as game, or as mere sport in no sense would be commendable, but in the protection of crops under certain strenuous conditions, in the writer's opinion, might be justifiable. Certainly protective measures along some line would be a comfort and profit to a large number of long suffering producers.—J. W. Whiting.

SWINE.

THE naturally clean habits of the pig may be observed in the razor backs of the extreme South. These animals run wild in the pine woods, their only shelter is the trees. I have seen their lairs in the soft, clean sand among the sweet smelling pine needles. When their carcasses are brought in by the hunters they are not mire-covered like the domestic hogs. The farmer is the sinner against cleanliness in the piggery. He keeps hogs of all ages, year after year, on the same ground, until they become infested with vermin. Fleas and lice find the climate good in California and multiply exceedingly fast. The irritation of the skin produced by these pests sends the poor unhappy pigs rolling in the mire.

Vermin.

Lice and fleas, small as they are, make up in numbers, and are the cause of weakness in young pigs that invites other diseases to make its inroads upon the weakened system. It is extravagant to feed a lot of boarders of this description, instead of healthy, robust pigs. The small pigs can be cleansed in a common tub filling it with water adding creolin to make a two-per cent solution. Have two men do the work and go all over the pig carefully with soft brushes or cloths. The sow is stood in a corner of the pen and scrubbed with the creolin water, using a broom. The spray can be used, but it takes longer and does not remove the dirt under which the vermin seek shelter. All the large animals can be treated the same as the sow, except his majesty the boar; he should receive a heavy spraying as he may turn vicious under the broom.

Tanks.

If there are several hundred head it pays to build a dipping tank. These tanks are made of galvanized iron and have a raised wooden platform at each end. The entrance board to the tank is an inclined plank with cleats that can be removed after the hog is in the water. A small chute is built at one end to send the hogs into the water. When washed the board is placed at the other end and the hog gladly walks out himself. As a hog drowns easily, the water should only be deep enough for him to stand in, not to swim. The backs of the hogs are well scrubbed by the attendants with brooms. The hogs standing for five or more minutes in the warm water will soak off the vermin on the under part of the body completely.

Wallow.

Where hogs are very wild prepare a wallow for them. Cut a ditch and

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

let the water fill in a spot that been scraped out to hold water. Before scraping it out build a fence around it. Turn in the and get out the big spray pump spray them all over with the creolin or with a distillate emulsion. A twenty-four hours let the hogs and repeat this again in a week time. Burn all bedding and refuse where the hogs sleep and treat the wallowing spots with the same compound.

Digestion.

The digestion in the stomach and intestines of swine is more near like that of man than any other animal. The pepsin used for indigestion is obtained largely from the stomach of the pig and is one of the valuable by-products that the packers pay the expenses of the packing house. Later it has been found that pork is not as healthy a food as people have believed. How could it when we find men of good education persisting in feeding dead horses and cows to pigs? Surely the law should interfere in this disgusting practice. Swine are not meat-eating natural and do not need this food. They eat it because it is simply easier to let them eat than to bury the horses and cows that die.

Fertilizers.

If on a large ranch there are a number of animals that are dying off it pays to have a simple way of boiling them up for fertilizer. After the alkali is off, cut the animal up and boil plenty of water until the meat drops from the bones; then grind the bones up and put them on the land at once with the next load of manure that goes out to the fields. The meat is cooked to shreds and can be mixed with sand or earth or muck and put on the land, as it is now made elsewhere.

ile by boiling from the bacteria of the common diseases of animals, it can be safely fed to the pigs and chickens. If middlings are added and boiled until well cooked and the whole mass poured into half barrels, it will cut out in cakes when cold. Do not add salt as the pigs receive in the house waste all the salt that is really good for them to eat. The many stories current about pork and dog sausages do not seem to me as serious, even if true, as the feeding of uncooked dead animals to hogs.

As long as sausages are used some one will cry out "dog." The boardinghouse keeper was sure that the sausages were dog meat, for he proved it. How? By giving his boarders sausage for every meal for a week when they all began to growl. Ricketts.

The alfalfa-raised pigs are not as much affected by ricketts as the offspring of sows that have lived on corn alone. Sometimes there will be a sow or two that seems to throw pigs with the weak hind legs and the wobbly gait. It is always lack of proper balance in the food and bad sanitation that causes this trouble. The slum children of the Eastern cities show the crooked legs and weak bones. Now if we put the sows in slum quarters and feed them slum foods, then we will have these weak boned pigs. The weak ones can be helped by giving them ground bone in the slop and by putting in a trough the following general tonic for them to take at will:

Tonic.

Common salt, four pounds; Black antimony, flowers of sulphur, sulphate of iron, one pound of each. Wood ashes, five pounds; charcoal, five pounds. We find it well to keep this mixture where the hogs of all ages can reach it. It acts as a digester and as an appetizer.

Feeds.

The ricketty pigs need a general widening of their diet. Now whatever you have been feeding change it to something like this: Middlings, four parts; oilmeal, one part; alfalfa hay all they can eat. Roots of any kind. Then add to the slop a tablespoonful of ground bone for each pig, and lime water to mix the feed, one gallon to every three of plain water. Then put a gallon of lime water in the troughs for each five gallons of clear water.

Ham and Bacon.

After all is said about the unhealthfulness of pork, we must not fear the cured product, as at every packing house the meat is carefully inspected for trichinae and for tuberculosis, the rejected meat going to make fertilizer. Ham and bacon will ever be a favorite food with the majority of people. Toast added makes it the wholesome breakfast for many people. The sweet odor of broiling ham that we all know, and can feel with the Jewish rabbi when he said: "Ham! ham! Thou almost persuadeth me to be a Christian."—M. E. Sherman.

The sheep men of the State are still working upon their organization and hope to have a working force that will soon be a factor in the prosperity of that industry.

Many new fruit evaporators have been built in Douglas county, Oregon, this year.

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

Pratts STOCK GUIDE

HINTS FOR STOCK RAISERS

IT SAVED THE HOGS

Remarkable Effects of Pratts Animal Regulator in a Cholera Epidemic

LE MARS, IA.—Mr. Henry Johns, of this town, who has raised hogs and other stock for the past 29 years, tells of a remarkable experience he had with Pratts Animal Regulator and Pratts Hog Cholera Cure. Some stockmen lost 50% and 75% of their stock in an epidemic here last Fall. Mr. Johns used Pratts preparations, and only one hog died.

"I shall always keep Pratts Animal Regulator around," Mr. Johns says. "I give it to hogs, cows, horses, sheep and other animals with splendid results. It has saved me a good deal of money."

CURES WORST CASES

Pratts Healing Ointment Saves Thousands of Dollars for Hog Raisers

Be sure you take prompt measures to cure all skin diseases and ulcerated sores and wounds as soon as they appear on your hogs. Otherwise you are likely to lose considerable money.

The most virulent sores, skin eruptions, scratches, cuts and itching are completely cured by Pratts Healing Ointment.

WORMS.—Look out for the worms. Pratts Specially Prepared Worm Powder will positively drive them out.

The Pratt Guarantee

Pratts Animal Regulator, Pratts Hog Cholera Cure, Pratts Healing Ointment and all other Pratt products are sold and guaranteed by leading dealers in your section.

With every package you get a double guarantee, signed by the president of the Pratt Food Company and also by your dealer, that they will do everything that they are intended to do.

Ask for the double guarantee.

Pratts Books

We are now printing the five books named on the following list. Simply drop us a postal card mentioning which you want and we will mail you copies as soon as they are off the press. The regular price of these books is 25 cents, but if you are interested in Pratt preparations you get them free.

Pratts New Horse Book.
Pratts New Cattle Book.
Pratts New Hog Book.
Pratts New Sheep Book.
Pratts New Poultry Book.

Let Us Help You

Pratts Veterinary Service is at your call any time, no matter where you are. If you have any troubles with your live stock or poultry—if there is any point about which you want information—just write to us. No charge for expert advice. We will be glad to help you.

DON'T BUY GASOLINE ENGINES

UNTIL YOU INVESTIGATE "THE MASTER WORKMAN," a two-cylinder gasoline, kerosene or alcohol engine, superior to any one-cylinder engine; revolutionizing power. Its weight and bulk are half that of single cylinder engines, with greater durability. Costs less to buy—less to run. Quickly, easily started. Vibration practically overcome. Cheaply mounted on any wagon. It is a combination portable, stationary or traction engine. SEND FOR CATALOGUE. THE TEMPLE PUMP CO., Mrs. Meagher and 15th Sts., Chicago. THIS IS OUR FIFTY-THIRD YEAR.

DAIRY TYPES.

While there may be no virtue shades or color markings, there distinctive types of dairy shapes forms. No true dairyman fails distinguish the dairy form from beef form. The latter form indicates a five or six cent product, the form a thirty or forty cent product. In the finer work there is the finer physical equipment, a physiological consciousness of a destiny and an ability to do something beyond the ordinary. Along with this pronounced dairy form the careful dairyman will wish his cow to have the constitution ability to stand the strain of work. In a given amount of time there is a well defined limit to a possible animal product, that is, it impossible that the cow shall return in her milk more than she was able to find in her feed. Some cows will return more than others, and here lies the profitable superiority of a cow over another; this particular point of superiority, this largest profit is the item in business dairy that makes colors, shades and spots questions of fancy only—Coleman Rural.

OVER-FED HEIFERS.

If you expect your heifers to develop into good milkers, don't keep them fat.

This declaration is made in answer to a question, from a Contra Costa county young farmer, who wants to know, "if it is the thing to do to keep his heifers fat?" We feel certain our Mrs. Sherman would say "don't keep your heifers fat for if you do you will ruin them." She will also tell you that to properly feed your heifers is an important thing if you expect to develop them to do business in the dairy.

The matter of high dairy performance depends to a very large extent upon the bringing up of the heifer. She can be trained to convert her food into milk and butter fat. Whatever course she will take after the first calf is dropped will be dependent very largely upon her previous treatment. This does not mean that a heifer from a beef cow can be fed so as to make a good producer, but it does mean that a heifer from the very best dairy cow can be spoiled by keeping her fat and sleek before she calves the first time. This has been our experience at any rate.

The well known phenomenon of "not giving down" the milk is claimed to be the result of lack of nervous tone in the glands, brought about by some kind of excitement. The udder is not a container in which the milk is readily stored up at milking time, but an organ in which the greater part of the milk is elaborated while milking or suckling is in progress, by virtue of the agitation produced. Unless the cow is in perfect repose this secretion will not take place normally. The lesson to be derived from this is that the cow should be treated with the greatest gentleness, and otherwise kept free from excitement, specially during the time of milking or sucking.

The improved cow is the cow that continually improves in her milking qualities. She is not the only improved cow, for the producer of good beef stock and of the improved steer is an improved cow. It is not only necessary to have the improved dam but the sire should also be improved, if the improvement is made that is necessary. Keep up the improvement, lest there be a retrogression.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

With the Citrus Growers

THE CITRANGE IN THE NORTH.

WE note in the Spokesman Review reference to experiments with the new fruit experiment—upon by the Department of Agriculture, and named "Citrang." Trees have been at Kenwick, Wash., and regarding them the dispatch states: "Much interest throughout the state has been awakened by James C. Crowell's experiments with frost-resistant oranges, or citrangs."

When seen today Mr. Crowell said: "The trees were received by me from the department early last winter. I followed the directions enclosed and fully heeled them in until this spring, when they were set out the same as any other orchard tree would be. Since then I have given them much attention, cultivating frequently and keeping the soil loose and moist. The trees have responded remarkably well to the care they have had, and this winter endured a temperature of 15 degrees below zero. I have little doubt but that the fruit can be grown successfully."

Three Varieties.

There are several varieties of citrangs now being experimented with by the department, and from reports received most of them will be suitable for this climate. The department has made but a very limited distribution of any variety, striving only to give its thorough trial and general opinion in cultivation if the variety proves valuable. The varieties sent for experimental purposes are the Rusk, Morton and Willits. The first of these trees to be issued for experimental purposes were the Rusk and Willits, of which varieties a few were issued in 1905. The Morton was issued a year later. Of course, in the department's experimental orchard, the trees have been under trial for a longer time. The Rusk has proved a very prolific variety, producing numerous well-formed fruits. A notable feature of this variety is the fact that the last seasons the fruits have been larger than those of preceding years, showing a tendency to produce larger fruit as the trees mature in age. The Willits has not proved so desirable. The fruit of this variety has a tendency to become very rough as the tree grows older. However, the pulp is said to be juicy, and can be used as an excellent substitute for the lemon or orange. The Morton trees last year produced a good crop of well-formed, well-appearing fruit, and will very likely prove to be one of the most valuable of the citrangs."

Mr. Crowell stated that the citrange should not be confounded with the orange. He says they are not oranges, but no more to be compared with oranges than lemons, but that they are only new fruits of the citrus group, and harder than the orange or lemon, and that they can be grown 300 to 400 miles north of the present orange belt. He also said that the chief use of the fruit was for culinary purposes and for making citrangeade, which they are highly recommended by the department.

The citrangs are propagated by grafting on two or three year old seedlings of the Trifoliate orange, which is a hardy stock, grown successfully anywhere in the southern part of the United States. The same careful care is recommended for the citrangs as is given the pear, apple and orange.

WHITE FLY AGAIN.

Last week we commented upon the statement that the life of an orange tree or grove after it was attacked by the White Fly was not to exceed three years. We disputed the assertions, knowing that at least one grove in this settlement had been infested by the White Fly for several years. Since then we have visited the grove and questioned the owner, Mr. M. S. Moremen, who is well known among the orange growers of this State. Mr. Moremen said that there had been White Fly in his grove since 1888, and that he had not lost a tree from that cause. Some years it has been so bad that he was obliged to wash much of his fruit on account of its being covered with the sooty mould caused by the presence of the fly. Mr. Moremen had quite lately finished spraying his trees and has but little trouble, that is, by means of this spraying he can keep it down so that they do not blacken his fruit. As his grove is surrounded by hammock on three sides which contain water oak trees, which breed the White Fly, it is impossible for him to get entirely clear of the pest.

We do not wish to be misunderstood by our California brethren; we do not blame them for doing all in their power to prevent the White Fly from spreading to other parts of the State. We should consider the money which it cost, well spent if it proves effectual. But we wish to assure them that its presence is not necessarily fatal to a tree or grove.—Florida Agriculturist.

TULARE COUNTY CITRUS FAIR.

Tulare county is maintaining its interest in its exhibition of citrus fruits. A great exhibit was made last year at Porterville which drew people from all over the State. This year's fair is to be at Lindsay and the date is Dec 3 to the 7th.

While it is a citrus fair and citrus fruits form the bulk of the exhibits, yet many displays of other fruits are made as well as there is of other soil products and even live stock.

It will be an interesting exhibit and well worth a trip to Lindsay to see.

Barnyard manure is the most valuable form of organic matter to add to soils, because it is rich as a fertilizer. For this reason the production and proper care of barnyard manure is just as necessary in farming as the growing of the staple crop. One of the great needs of some important agricultural sections is a great increase in livestock to produce manure and make possible the growing of a greater variety of crops, such as are required in an intelligent rotation.—George H. Failyer.

It is not idle to sound this warning, that unless the next generation in the Middle West put the fields under systematic crop rotation and better system of farm management, fertilizer problems such as are now confronting the East and South will have to be met before many decades.—W. M. Hays.

The Healdsburg Enterprise says that the range of wine grapes this season was extreme, from \$28 to a much lower figure. The average is claimed to be not far from \$22.

Newtowns are being quoted at Watsonville at \$1.40 to \$1.50.

The Superlative Raspberry

Too much cannot be said in favor of the Superlative. It is a red, sweet berry three times as large as any other Raspberry, to my knowledge. It is a continuous cropper from May to November. I counted on one cane 472 berries of different sizes. Just think of a sweet raspberry as large as a Red Logan. Do you know what that means? It means for years to come heavy demand for fruit and plants. Every nurseryman will want a heavy supply. I received 5,000 plants from the introducer in Europe last Spring, and another 5,000 will arrive in November. I offer 2-year-old Plants now at 50c each, \$5.00 per 12, express paid. Going fast.

A. MITTING, 17 to 23 Kennan St., Santa Cruz, Cal.

The Vegetable Garden

THIS MONTH.

TRANSPLANT tomatoes, cabbage, cauliflower, etc., to field. Celery will need hilling. Sow cabbage, cauliflower, beets, onions, spinach, Swiss chard, peas, radish and turnips, lettuce, etc. This is really "Second Spring Time" of the year. You can plant nearly everything this month.

Peas planted now and given good care will give Christmas cheer. Plant the early variety.

Of course, it is only in frostless places where tomatoes are to be planted or sown now.

Rake up all dried vines or leaves, weeds, etc., and compost in compact pile or burn. This to get rid of many insects.

SELECTING SEED POTATOES.

That improvement of plants and animals may be accomplished by selection of the parent stock has become a generally accepted theory. Some species of the domestic animals have, after several centuries of selection, been bred to almost a perfect type.

Within the past few years a great work has been done along the line of improvement of plants by selection, especially corn and the other cereals. Probably less work has been done toward improving the potato than with any of our other great food plants. Yet enough has been accomplished to prove that no plant can be more quickly improved both in quality and yield than the potato.

It has been a common practice in the Eastern States, and to a certain extent in the West, among those who grow potatoes for family use, to plant only the small potatoes and culls that are left in the spring after the supply for the house has been picked out. This is, of course, the worst possible kind of selection, and always results in degeneration, or what is known as "running out" of the stock. Because of this, varieties of one generation are unknown in the next. On the other hand, there are localities in Colorado where the same variety of potatoes has been grown for the past twenty-five years, and is better and more productive now than when introduced.

Commercial growers have not made this mistake to so great an extent, but have generally made a practice of selecting a good type and a medium size of tuber from the bins during the winter for the following crop. In this way some good seed is planted, but for several reasons a large per cent is poor seed. A potato tuber is not a seed, but a part of the plant from which it came, consequently the characteristics of the parent plant are more sure to be reproduced in the new plant than in plants that are grown from seed that are the union of two parent plants. A little observation in the field when great variation in the different hills digging will show that there is of potatoes on a given area. One plant may have ten or twelve good sized, smooth, marketable potatoes. The next may have one good potato with three or four small or inferior potatoes, or possibly a hill may have but two medium sized potatoes of the same type as the first hill. Now, if the selection is made in the cellar, about as many of the seed potatoes

will come from poor hills as from good, and the result will be to produce more poor hills, and this continues from year to year tends to decrease the yield of potatoes.

The best way to select is to take only good potatoes from hills that produce nothing but good potatoes and a goodly number of them. This work may be done by digging by hand, but so many hills have to be discarded that it makes the work slow and expensive. If the potatoes cling to the vines, the selection can be made by following the digger. The system used at the Colorado Agricultural College Experiment Station is to plow out the rows with a common mold-board plow. This leaves potatoes on the vines with most the tubers exposed on the surface of the turned furrow. Not more than ten per cent of the hills will be suitable to select from the first year, these planted ought to produce much higher grade of potatoes from which to select the next year.—E. Bennett, Potato Specialist, Colorado Agricultural College.

BLACKBERRY CARE.

A dish of luscious blackberries fresh from the vines while the dew yet on them is a magnificent breakfast dish. They are enjoyable to the same degree as are the ones bought of the vegetable selling Chinaman, dried and hard at center, disappointing. Plenty of water with fertilizer and tillage makes luscious fruit.

With blackberries it is so simple to produce such fruit that it is a wonder there are not more in our gardens. A half dozen vines are sufficient for one family. In fact, the writer picked from one vine, the only one in our garden, many fine breakfast dishes this season. It had plenty of water and fertilizer. But it paid. Don't plant a long row—unless you expect to sell or give away—but have a very few fine vines.

Regarding culture, a writer in *Home Progress* says:

"The essential point in growing blackberries successfully is a moist soil, not one in which water will stand, but one rich enough in humus to hold sufficient moisture to carry the plant through the growing season. It is usually best to plant the blackberry bushes in the fall, setting the smaller growing kinds 4x7 feet apart and the larger varieties 6x6 feet. Thorough cultivation throughout the season will help in a material degree to perfect a good crop. The soil should be cultivated very shallow, so as not to disturb the roots. Breaking the roots starts a large number of suckers which have to be cut out and destroyed.

"Blackberries, like dewberries and raspberries, bear but one crop on the cane. That is, canes which spring up one year, bear the next. From three to six canes are sufficient to be kept in each hill. The superfluous ones should be thinned out as soon as they start from the ground. The old canes should be cut off soon after fruiting and burned. The new shoots should be pinched back at the height of two or three feet if the plants are to support themselves. If they are to be fastened to wires, the canes may be allowed to grow through the season and be cut back when tied to the wires in the winter or early spring."

Ginseng Culture

Successful in California

One acre worth \$25,000. You can grow such a crop, and we can tell you just how to do it. We have 60,000 roots growing thickly in our garden near Santa Cruz. You need California grown Ginseng to begin with. Our stock is limited. We shall not sell enough to cripple our own garden. Write us for information regarding conditions, space required, price of seed and roots, etc.

The Ornamental Garden

THIS MONTH.

A MORE INTERESTING period is now beginning for the gardener. The beds have been spaded and fertilized and now the sowing of seed of annuals for next spring's blooming is in order. Plant sweet peas, pansies, mignonette, scarlet flax, stocks, scabiosa phlox, dianthus and other annuals. Such bulbs as now can be bought may also be planted. Most seedsmen have yet to receive their fall stock, but plans may be made and some varieties planted out and especially hyacinths, tulips, narcissus, amarillis and Dutch bulbs. On last of month plant gladiolus, roses and thoroughly water them, give lots of manure and you will have good flowers if you did not let them grow during last two months.

In cooler sections where roses have become dormant they may be transplanted. Old bulbs which need replanting which have not been lifted should be taken and divided now.

The old lawn may also be given good fertilizer and renovating by pulling weeds. For each weed pulled put in a pinch of blue grass seed then watch it grow.

STREET TREES.

I AM asked to reply, through the Cultivator, to the following inquiries from San Luis Obispo.

"What is the best variety of trees for street planting in this location, the following points to be considered. deep roots, that will not disturb side walks and curbs, hardy, evenly shaped and not overly large when grown?"

"Would also like information as to best plant for narrow parkways between walks and curbs. Is there anything better than Lippia?"

While a great variety of trees are found on the lines of our California roadways, the list of those that have proven even fairly satisfactory in all respects, is comparatively short.

Among the limitations, I think our semitropical conditions call for evergreen trees on our streets and avenues as a rule.

Characteristics required should include proven longevity. A tree short lived under street conditions, however desirable otherwise, should not be planted on the avenue. The line after being partly grown, can never be made uniform after individual trees begin to drop out.

Form and foliage should be pleasing as individual trees, at the same time giving desirable effect in avenue line. Many varieties desirable, single or in groups, are unsuitable in continuous line.

The avenue tree should be able to endure some hardships and neglect.

Of shade trees complying with these requirements, adapted to San Luis Obispo and similarly located towns in California in a general way, I do not hesitate to place the pepper first. I do not mean the ill-shaped sickly pepper frequently found in our California towns, but the pepper possible with a little intelligent, persistent care from the planting. Erect, straight bodied, with frame work of top carefully formed and kept shape-ly by occasional pruning. While in the roomy open it sometimes assumes a broad, wide and spreading top, grand in proportions as the oak, its

habits of growth are such that its size and shape may be controlled by street conditions. With deep planting and a little after care its roots need not disturb pavement or curb. It is a fast grower, responding quickly to a little special care, soon entirely transforming the appearance of a street. As it matures it will bear pruning sufficiently high to expose frontages on residence streets, and the sky-line along open spaces, a most desirable feature.

The pepper as a shade tree, is to California what the maple is to the Middle States, the elm to New England and the oak to the South. It is the tree most admired by our visitors and enjoyed by our own people.

For a smaller, slower growing tree, the black acacia—Melanoxylon—fits the requirements as well as any of our thoroughly tested shade trees. It will not bear high pruning. For some years at least, it takes a compact, conical shape, but if desired for shade, by checking the upright growth, it becomes a wide spreading, handsome umbrageous tree with its thick, dark foliage giving a pleasing avenue effect.

Where shade is not desired some of the hardy varieties of the palm family are among our most desirable trees for the street. The stateliness of the native California fan palm, when well grown gives one of the most striking and pleasing tree effects on our avenues. The Washingtonia Robusta is at present more popular with us. Under favorable conditions is a fast grower, holds its fronds green much longer than the native palm, occupying less space, is better adapted to narrow street margins. It is an ornamental palm while young, and quickly makes a pleasing showing on avenue lines. To my own taste, when mature its thin stem gives a less stately effect than the thicker stemmed native variety.

Space does not allow me to discuss several varieties, in many respects admirably adapted to street ornamentation, which few special reasons do not seem to me so safe and suitable as above, for general avenue purposes, but for special locations may be more desirable than any of these mentioned.

As to the second query. Where a well kept lawn is not practicable for the purpose mentioned, Lippia is doubtless, the best plant yet introduced.—J. H. Reed, Riverside.

We are glad to say that Mr. Reed will furnish a few articles to Cultivator readers on planting and care of street trees. Mr. Reed is Tree Warden of Riverside and in that capacity has done magnificent service for that city. For that service and his many admirable qualities Mr. Reed is one of the loved of the earth.

A GOOD TREAT.

The sport—How can you tell a young partridge from an old one?

The kid—By the teeth, sir.

The Sport—You little idiot! A partridge hasn't any teeth.

The Kid—No, but I have.

NOT TWO OF A KIND.

Dinks—Twins at your house, eh? I'll bet they're pretty boisterous.

Winks—Partly so. One of them is girlsterous.

Imperial Valley Farms

Wonderful Opportunities for "Real Farmers."

Cantaloupes, Grapes, Onions, Asparagus, and all garden produce get the early market and thus the high prices.

Alfalfa, Hogs, Dairy Cows, Sheep and Beef Cattle cannot be raised anywhere with greater profit.

The great need of the Valley is for "real farmers." At present you can buy lands at the same prices as some improved lands are now renting for. The Valley is fast becoming the Great Feeding Ground of the Southwest.

Cantaloupe and garden land to lease for cash or on shares.

MACADAM ROADS.

"Will you please state in the Cultivator whether in your judgment the Macadam road is the best road to make in towns of from four to six thousand inhabitants?"

In reply to the above question we would say: Macadam roads of late years have been regarded as expensive and not as durable as was formerly supposed. The Macadam type of road surfacing is well adapted to thoroughfares connecting centers of population where there is a moderate amount of travel. It has been found since the advent of the automobile that Macadam roads do not last any considerable length of time without repair, for the reason that the suction from the rubber tires has the effect of tearing up the binder on the road, creating an uneven surface which, when broken, soon leads to chuckholes. The Department of Agriculture has recently issued a bulletin in which is given in detail the best system for Macadam road construction. In this report it appears that the road was originally devised by John L. Macadam, a Scotch engineer, in the early part of the last century. It was used very generally in the Eastern States, obtained considerable popularity in the Middle States, but on account of its expensive nature it has not been used much of late. In its stead the coal tar and asphaltic oil with a substantial base has been used with success. In this State excellent roads are made from heavy asphaltic oil with a proper foundation and a heavy gravel surface. We could not recommend the construction of Macadam road for rural districts, nor for towns, as the oiled road can be made very much cheaper. The Macadam road is not an economical form of pavement for the main streets of cities and towns and is too expensive for country use.

RURAL MAIL DELIVERY.

One of the elements which has made the life of the farmer attractive in late years is the rural free delivery of mail. Although he may be situated miles from town, the farmer is yet in touch with commercial interests of the country as much as if he lived within a mile of a telegraph office. He can reach his bank by mail every day and transact business without the inconvenience of going to town twice or three times a week.

His wife can order, through the mail, groceries for the home in advance of the delivery wagon which makes tri-weekly trips into the country, and his children can also order what they want in bundles of the statutory weight, to be sent by mail.

There are still many sections in this State where the rural free delivery system has not been established. This may be owing to the lack of enterprise on the part of the inhabitants of these localities, in pushing their claims, or it may be that the districts are too sparsely settled to permit of a free delivery route being established. But in any event, wherever a route can be put on it should be. It is a time-saver, and a money-saver, to every farmer in the land, and if the matter is pressed upon by the postoffice department, through the member of Congress residing in the district, it will result in establishing a free delivery route where conditions will warrant the postoffice department in establishing one.

As a general rule farmers do not demand of their representatives what they are entitled to receive. Congressmen and Senators know that their tenure of office depends on the votes of the agricultural class and they will be slow to oppose any appropriation which is calculated to affect the farmers' interests, and knowing this, they will, if pressed, look after the farmers' interests first.

There is no other single benefit of such general importance to farmers as rural free delivery, and politics cuts no figure when a measure pertaining to that service is before Congress. The farmer is entitled to every convenience it is in the power of the government to furnish him and the cost is a matter of secondary importance. Comparatively speaking, the farmer receives less from the government than almost any other class of citizens. Practically the only congressional appropriation that directly affect him are those made for rural delivery, agricultural experiment stations and good roads. This being the case, the agricultural class is justified in demanding rural delivery, agricultural experiment stations and good roads.

An unprejudiced observer, visiting the pavilion, will come away with the conviction that almost any product grown anywhere in California can be grown to an equal perfection almost anywhere else in California, but that nowhere else on this continent can any such range of production be coaxed from the soil as in this State. California is a wonder.—Sacramento Union.

THE MEDITERRANEAN FRUIT FLY.

Continued from First Page

these were fully grown on the 25th March and went into chrysalis on that date.

In connection with egg-laying I find that from four to seven eggs are laid in each puncture or chamber, and not alone does the fly puncture the fruit, but it also constructs an oval-shaped chamber which is apparently lined with a tough brownish substance. At Numurkah I found four tiny elongated eggs of a dirty white color, and these, when seen under the lense, shone similarly to the body of a young larvae. The eggs lay parallel to each other, and occupied about half the capacity of the chamber. The young larvae hatched out on the following day, but we did not succeed in rearing them. I have found four larvae each in a number of peaches which had apparently only one puncture each. I have also found twelve larvae in peaches where only three punctures each were visible. Then again I have found five, six and seven larvae in peaches, each of which had apparently only one puncture, but I have never found less than four in any peach. Therefore it is only reasonable to conclude that from four to seven eggs are deposited in each chamber, and that four are more frequently laid than any other number. Flies are apparently not fit to lay until they are four days old.

An analysis of the above will show that from the time the egg is laid until larvae is fully grown is 12 days; that the chrysalis stage is 13 days;

that the life of the perfect insect when fed is days; that from the time the egg is laid until the insect which it contains dies of old age is 50 days; that when the fly is not fed the 50 days are reduced to 29 days.

I have not been able to determine the term of the eggs' incubation.

In Western Australia, Mr. Fuller remarks, "the fruit is attacked directly it begins to sweeten and before it ripens, green fruit being seldom if ever attacked. The eggs are laid in the fruit by means of a very sharp needle-like organ called the ovipositor borne on the extremity of the abdomen of the female. The maggots are soft, yellowish white in color, somewhat shining and limble worms, and somewhat resemble those of the men fly. The pupa and chrysalis are oval and stout at first a golden yellow but subsequently changing to a reddish brown. The flies are pretty little insects with two wings only, about half the size of the common house fly. They have very large and lustrous eyes, the thorax is mottled with grey stripes of a silvery grey color. The wings are large and simple. They are transparent, strongly veined, and marked by several clouded bands of grey and yellow color. In walking the fly always carries its wings in a drooping attitude. It is a very difficult thing to find the fly in an infected orchard, although they may be present in large numbers. If, however, a maggoty peach be put aside in a box for a few weeks the flies can be reared and easily observed.

It has frequently been stated in Queensland and New South Wales that the flies will not attack green fruit. This is a mistake, as I have on many occasions proved eggs to have been deposited in green bananas before shipment, as no half-ripe bananas are ever shipped from Queensland to Melbourne. This fly would appear to be more numerous than are the other kinds here mentioned. No less than 60 adult specimens have been reared at our office from two specimens of the bitter or Seville oranges which have been sent from one of the northern ports of Queensland. The indications of the presence of the fruit-fly larvae in such fruits as the citrus family are, although easily detected by the practised eye, upon the whole not well defined. The skin of oranges, lemons and limes being more or less of a rough granulated texture renders the task of finding the infected fruit, where large consignments have to be handled, by no means an easy one.

In Victoria, at least, it is astounding with what rapidity this fly destroys the fruit in the orchard, only a few days, in the case of peaches, elapsing before the whole of it is rendered unfit for human consumption, it, the fruit, being absolutely decomposed and discolored. In Victoria, our experience has taught us that the first fruit to be attacked are apricots, then peaches, then, as the broods hatch from the ground, other fruits, as apples, pears, persimmons, etc., are attacked in succession. From observations made in the field, I am speaking of the north-east part of Victoria, the trouble has been traced through the medium of imported fruits, bananas and oranges especially, infected fruits of both kinds being commonly obtainable in Melbourne, the suburbs, and in the country townships. Those who have carefully studied the habits of the fruit-fly are aware that their flight is but short, and judging from their habits in our Victorian orchards it would appear that the fly does not favor long distance journeys, although, as with some other kinds of short flight insects, it would be possible for this pest to fly or be even blown across the Murray. This is, of course, a mere surmise, but the fact of the grubby fruit being even obtainable in Melbourne and elsewhere, goes to prove how necessary are the extra precautions now being taken by the Department. As one who has seen the fly at work both in New South Wales and Queensland, I assert that the ravages of the Mediterranean fly in Victoria are quite as bad as either the Queensland or New South Wales experiences have been able to record, half-green peaches being attacked as badly as those either ripening or ripe. The perfect Queensland fly has not, as far as we are aware, made its appearance amongst us, and we sincerely trust it may not do so.

Referring to the life history of the Mediterranean fly as observed in Victoria, the female insect punctures the skin of the fruit when the latter is in the condition of being half-grown, hard and green to that of ripe or ripening fruit, and by means of ovipositor places from five to fifteen eggs in each fruit. These hatch out in a few days, the maggots remaining in the fruit for about fourteen days. The fruit then drops to the ground and the maggot or grub enters the earth to the depth of a few inches, and there assumes a chrysalis form, from which the fly emerges in from 14 to 20 days, according to climatic condition. In a climate like Victoria, it is thought possible, taking the succession of fruits into consideration, that we may have a fresh brood for nearly seven months in the year. It has been questioned by some persons whether this fly is found in Queensland at all, but the fact of it having been reared by us from bananas and oranges from Maryborough places the matter beyond the shadow of a doubt. If such be not the case, then the fruit must have been affected during transit, a theory which I, for one, will not entertain.

Agricultural Notes of the Pacific Coast

Northern California

Levee work in District No. 2, Sutter county, is progressing.

"More hogs more prosperity" is the aim of the Gridley Herald.

Prunes ripened about three weeks earlier about Chico than usual.

A ton to the acre is being yielded by some hop yards about Healdsburg.

A new cannery is to be established at Marysville during the coming season.

Sacramento wine makers are paying \$14.50 per ton for grapes at Yuba City.

The outside hop pickers in most of the yards have returned to their homes.

Large numbers of resistant vines will be planted in Mendocino county this season.

A sheep herder was fined \$100 in Yuba county for trespass of the forest reserves.

Sutter county claims that her grapes are one-fourth larger than usual this season.

The olive crop of the Sacramento valley is reported to be much larger than that of last year.

Next spring will see a large area of pecans and English walnuts planted in Glenn county.

The Sutter county creamery recently started, has an output of six hundred and fifty pounds daily.

Trinity county is offering a bounty on coyote scalps owing to many sheep being destroyed by the pests.

Soil conditions in Yolo county, especially about Woodland, are said to be most friendly to sugar beet culture.

Northern Sacramento valley had a visitation of rain last week, but not heavy enough to do either damage or good.

Tons of tomatoes in Manteca and Yuba sections are going to waste owing to inability of canners to handle them.

Surface water all pumped out of District No. 556, near Isleton, puts that section in line for cultivation again.

Plans are being considered for the improvement of Yuba slough by which much valuable land will be reclaimed.

The annual convention of the California Creamery Operators' Association will be held at Davisville, November 22nd and 23rd.

The absolute freedom with which grapes were given away during the Idi (Tokay town) grape festival surprised all attendants.

While United States Senator Tillman was in Santa Rosa recently he killed upon Luther Burbank and investigated the spineless cactus.

Petitions are being circulated in many sections of the Sacramento valley asking Governor Gillett to reappoint Elwood Cooper as Horticultural Commissioner for another term of four years.

One hop yard wishing additional pickers near Tehama advertised for pickers \$1.00 per hundred, bonus 10 cents, tents free, fire wood free, with music, dancing, athletic prize contests as additional inducements.

Central California

Kerman is to make experiments in raising tomatoes.

Eastern Fresno county is said to be some on Black Eye beans.

Selma has a peach tree which bore 13 boxes of fruit this year.

Nectarines are bringing ten to fourteen cents a pound at Fresno.

Kingsburg has two acres of peaches which yielded 20 tons, netting \$1200.

Prof. Bioletti claims the present season's output will exceed that of any year.

Fresno and Tulare county report the promise of large citrus output this season.

Canners are said to be reaping great profits owing to prices on canned fruit this year.

Congressman Needham delivered the opening address at the Hanford Fair last week.

Selma claims a pear orchard which is now giving its second crop of peaches this season.

Fresno agricultural fair has been declared a success and that without the betting adjunct.

In voting \$20,000 with which to build water systems Dinuba had but three opposing votes.

Fresno has the banner peach tree, as its owner claims a net return from it this year of \$33.80.

Stock generally in healthy condition is the report of Stock Inspector, Griffith, of Kings county.

Two hundred tons of dried apricots was about the extent of the Fresno crop this season.

Hanford Sentinel says that drainage is one of the most important questions of that section.

Some growers declare that the output of raisins this year will not exceed nine million pounds.

The Armenian raisin growers near Fresno are to organize a branch of the "Stand Pat" club which is holding for six cents.

The fair and races which were to be held at Bakersfield has been called off because of lack of support on the part of business men.

Salinas is still making some trip-hammer blows for more extended irrigation for that section and is hoping for government aid.

Salinas is producing oats the seed of which was brought in from Ireland, which is claimed will prove superior to our native varieties.

Assistant Secretary Hayes, of the Department of Agriculture, reports that Kearney Park near Fresno, is an ideal place for an agricultural school.

Pajaro valley is planning for a great produce festival to commence October 15th. Of course, apples and strawberries will be the principal features.

"Rain-maker" Hatfield has contracted with farmers at Crow's Landing to deliver ten inches of rain between November 15th and April 15th, for \$300.

The State Grange is holding its thirty-fifth annual session in San Jose this week. The people of San Jose have given a royal welcome and a good attendance. Much interest is shown.

Southern California

Ranchers at Beaumont, Perris, and Moreno are planting grain.

Oak Glen, near Redlands, will produce 800 tons of apples this year.

Twenty threshing machines are at work in Ventura county bean fields.

Beaumont is to have a eucalyptus grove which will cover several hundred acres.

The government is rushing its resurvey of the lands of the Imperial valley.

The first lima beans of the year were delivered at the packing house at Saticoy last week.

Santa Ana poultry growers are swinging into line for a county poultry organization.

It is estimated that the bean crop of Ventura county will not exceed 500,000 bags this year.

Riverside claims to be some on pears and has grown some exceptionally fine fruit this season.

Yucaipa valley produced nine thousand sacks of barley and thirty-five hundred tons of hay this season.

Ventura has finally dropped the San Buena from the front of its name and is now officially "Ventura" only.

Several wells are being sunk in Yucaipa valley which it is expected will supply sufficient water for irrigation.

Garden Grove claims to have pines growing on a fruit ranch which will produce as fine pine apples as any section.

Sixteen hundred cars of oranges is claimed to be next year's output from Highlands, East Highlands and West Highlands.

A mutual fumigating company has been formed in Orange which is co-operative in its plan of fighting scale and insects. D. F. Campbell is president.

The fruit men of Ventura county are still active in their efforts to have the sulphur ruling changed before another season opens.

The Coachella Valley is waking to the necessity of protecting its underground water supply by capping the wells which have in the past been left to waste vast quantities of water.

One result of the campaign recently started in San Diego county to wipe out the Texas tick is an enthusiastic co-operation which it is now probable will lead to extermination of that pest.

Arcadia in the outskirts of Los Angeles is soon to have a race track which it is claimed will take the place of Ascot, the gambling center, which was wiped out by being taken into the city limits of Los Angeles.

Riverside Press reports glorious prospects for the coming output of citrus fruits, while the output will not be exceptionally large, it will be fair, and the quality so far as can be judged at this date, will be of the finest.

The Colton Fruit Exchange shipped 262 cars of oranges last year. The directors elected to transact business for the coming year are James Barnhill, E. F. Van Laven, W. S. Bullis, E. D. Roberts, W. W. Wilcox, L. C. Newcomer, T. E. Moon, Wade Purdum, J. B. Hanna.

The Coast

Oregon potato yield is twice that of last year.

Nampa, Idaho, is shipping draft horses to Los Angeles.

The Palouse country will have its largest crop this season.

Best grades of hops in Portland is commanding only 8 cents.

Eggs at Denver are selling from eighteen to twenty-three cents.

Hay in eastern Washington is being injured by continued rains.

Oregon will ship over three hundred cars of onions this season.

There are forty prune evaporators at work near Newbury, Oregon.

More entries of draft horses than ever is claimed for Spokane fair.

Potatoes are being quoted in Portland market at 80 cents per sack.

Threshing is being delayed in northern Idaho by continued rains.

Notwithstanding the low prices of hops, picking is being rushed at north Yakima.

Kennewich, Washington, is experimenting in growing of frost-resistant oranges, "citranges."

A four days' harvest festival at Palouse, Washington, is said to have been a great success.

Riverside, Washington, held the most successful agricultural fair in its history last week.

The first car of Bartlett pears ever shipped from Kittitas county, Washington, was forwarded last week.

The Portland Oregonian says that the revival of the county fair is gratifying to agriculturists of the Northwest.

Over four hundred thousand head of sheep were sent from the Hood river section, Northern Idaho, this season.

Silverton, Oregon, crop of hops is fifty per cent less than last year. Many large yards have not been harvested at all.

Stevens county, Oregon, will ship about five hundred carloads of apples to one firm, being practically this year's output.

An Agricultural fair at Nelson, British Columbia, will offer special premiums for agricultural products of the prairie provinces.

The largest and most modern prune dryer in Oregon is located near Dallas. It has twenty tunnels with the capacity of 750 bushels a day.

Lumber men of the Northwest are glad to see the rains which are already coming, as it gives opportunity of floating over 30,000,000 feet of logs to the mills.

One farmer at Dayton, Washington, has a team of mules valued at \$5000. The team consists of thirty-two animals and is used to propel his combined harvester.

A threshing outfit at Sanwood, Washington, with a forty-five-inch cylinder threshed seventeen hundred sacks (average one hundred and six pounds) in ten hours.

Montana State Fair is being held this week. Agriculture will not hold the strong position that mining will, and it is claimed over \$100,000 in bullion will be exhibited.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co., Indiana and Yolo Sts., San Francisco, Cal.

Also Pioneer Manufacturers of High Grade Fertilizers.

Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POSSIBILITIES OF POULTRY ON A SMALL LOT.

WE are often asked what are the possibilities of poultry on a small lot? And how many birds can I handle profitably by doing all the work myself?

The first question we can answer better by giving some experiences of people we know who are making a success of raising poultry on a city lot. What can be done on a city lot can be accomplished on the farm or ranch on the same space with the same care and feed.

We are only going to give what has been done with thoroughbreds, for most land in California is too valuable to experiment with the common barnyard fowl.

Cost of Thoroughbreds.

The actual cost in care and feed of a pen of thoroughbred fowls amounts to no more than the common fowl. While the first cost of thoroughbreds is more, say twice what we would pay for the mongrel, yet the income is greater in dollars and cents, to say nothing of the difference in looks between a well selected flock of thoroughbred birds and the nondescript "happy-go-lucky" flock.

I don't believe I ever heard of an egg record being kept and account of stock being taken of a flock, excepting thoroughbreds.

A Small Flock.

We will give an accurate account of what was done with 75 pure bred Wyandottes for seven months and eight days of 1907.

This flock was carefully selected and had in it some show birds, or rather birds that had won prizes, and were attended to by a business man. So this flock can be counted as a "side issue" only and not the main dependence of the poultryman.

We believe a flock of 75 birds is a fair estimate of the average flock found on most farms or ranches in California where poultry is only kept as an adjunct and run in connection with general ranching. Still what ranch or rancher's wife could not find a good use for the profits that were turned in by this small flock.

The total receipts for the seven months and eight days were \$291.95, or a little over \$40 per month. Disbursements: Advertising, \$19.50; feed and supplies, \$50; paid for stock, eggs and express, \$37.45; total, \$106.95; net profit, \$185, or over \$26 per month.

The item in the expense bill of \$37.45 paid for stock and eggs, may not be quite clear to some of our readers. This amount was paid for breeding stock and eggs for setting, which were afterwards sold.

Other items which would make the profits greater if figured in, would be eggs and stock for table use, as all feed was charged against the birds; all eggs and stock used for the table should have been credited at market prices. We are sorry that we cannot give the value of the flock at beginning and at close of the time the record was kept.

How Much Profit on 1000.

The question naturally arises, can I make the same profit in proportion

on 1000 birds by devoting my entire time, as was made on the 75 birds. This can only be answered in a general way, as it all depends on the manager. Perhaps 100 birds is all one can handle profitably, while another may handle twice that many and the third ten times; it all depends on the man "behind the gun."

Learn to handle profitably 50 birds then double that number and so on until you reach your limit.

The number of birds a man or woman can properly care for depends entirely upon the man and conveniences he may have in appliances, houses, yards, etc. Many failures in the poultry business are due to the one cause of trying to care and house more birds than can be done. Better have 100 well fed, well housed and properly looked after than 400 half fed and mismanaged.

AROUND THE YARDS.

October work.

Prepare for winter.

Cull the flock, sell the drones.

See that your poultry houses are in condition for the rainy, cold season.

Healthy flocks, as a rule, are hearty eaters.

Green food fed at noon will, in place of a grain ration, increase the egg yield, give better fertility and stronger chicks.

Don't confuse balanced ration with "mixed diet." The former refers to the proportion of nitrogenous to non-nitrogenous nutrients in the ration; the latter, of course, only refers to a mixture of foodstuffs.

Feather pulling is the worst vice a hen can have. Catch the guilty ones that do the feather pulling, take a sharp knife and trim the edges of their beaks, and feed them plenty of lean meat. They generally commence by picking the combs and wattles of the cockerels and making them bleed; the blood gets on the feathers around the neck, and the hens eat the feathers by plucking them from each other.

Don't make the mistake of keeping more birds than you can properly house and care for. If you have been fortunate in hatching a goodly number of chicks and there is any doubt as to the number you can house, cull close and give the birds the benefit of the doubt. Fifty hens well housed, well fed and properly cared for will return more profit than will 100 half fed and crowded into quarters too small.

Age of Breeding Leghorns.

Will you tell me at what age white leghorn hens are old enough to breed? I have some nine months old, would their eggs now be considered pullets' eggs, or hens' eggs? They began to lay when five months old and their eggs are now as large as hens' eggs. —F. T., Santa Ana.

Your Leghorn pullets are old enough to breed from now or even at six or seven months old, if they began laying at five months. Birds are consid-

ered pullets until they are one year old.

Intestinal Worms.

I have just killed a young chicken among whose intestines I found worms about two and one-half inches in length, yellowish white and quite pointed at both ends. There was also one in the stomach and there was a hole in the walls of that organ through which the other worms had evidently got out.

Please tell me how to eject these worms. I suppose there is nothing to do after they have got through the lining of the stomach. The chickens have been drinking from water which was almost standing. All my chickens, including the one I killed, seem to be well, but I am afraid some of the others might be infected anyway.
—R. E., Kingsburg.

For each afflicted bird, give about twenty drops of turpentine in a teaspoon of sweet oil. For treatment of flock give about thirty drops of turpentine to a quart of drinking water, and give a teaspoonful of sulphur to twelve fowls fed in a mash. This will rid your flock of the trouble.

Chicken Pox.

I have a flock of eleven young turkeys about four months old. A few weeks ago they began to have little lumps all over their heads, which I supposed were just the natural roughness. These lumps have grown larger and more numerous until their heads are almost covered and their eyes almost closed.

I am new to California and new to the poultry business, only coming here in May, but I have a nice little stock of chickens, besides the turkeys. I have given them every care possible so feel particularly worried about this disease.

I find the Cultivator a great help in many ways.—Mrs. H. C. H., Anaheim.

Your turkeys have Chicken Pox. In Sept. 19th issue of the Cultivator you will find an article on Chicken Pox and treatment of same.

Roup.

Will you please let me know through the columns of the Cultivator, what is the matter with my young chickens. They are between two and three months old. And they are beginning to go blind, in both eyes, and then they die.—F. Y., Lodi.

We wrote to Mrs. Y— asking for further information and have diagnosed the case as swell head or roup. Treatment: I would open the swelling at a soft point and clean out matter then work or inject full strength sulpho-napthal, and apply same to canker. Add a few drops kerosene oil to drinking water, make every sick bird drink the water for three days. Or if you can get a reliable roupe remedy, procure it and give according to directions.

Duck Eggs.

How early in the fall can Indian Runner duck eggs be set?—Mrs. J. M. W., Santa Paula.

After your ducks are fully matured and are laying eggs that are normal size, we would not hesitate to set them.

FEEDING DURING MOULT

Feeding, at this season of the year should be given as much attention as at any other time, in fact, proper feeding during this month is of vital importance for the welfare of the fowls. Not infrequently we have some of our hottest weather during the month of September, and as a consequence irregular or improper feeding increases the liability of the fowls to get out of condition.

The old stock is now going through the moult and upon proper feeding and care depend their future usefulness in the show room. Most breeders do not give this question the attention it deserves. Many a bird has been ruined for the show room by lack of attention in the matter of feeding.

Different Feeding.

Different breeds and varieties of breeds require somewhat different

Hen Fruit Pays. If you want more, feed

Egg-More

Poultry need to be fed a scientifically balanced ration as much as any other stock. Egg-More is just the thing to mix with good grains to make the same a rightly balanced ration. It is highly nitrogenous, very rich in protein, will keep the hen in good health, sustain her system properly, and enable her to lay lots of eggs when they are scarce and high. Just a little fed daily with good grains, or even with bran, as directed with each package, will do it. It can be fed either dry or as a mash. It contains no cheap filler; the hens like it, they eat it, there is no waste. It makes the cheapest Egg Food especially if you can buy your grains at home cheaper than to ship them in. Many so-called "poultry foods" and "egg-makers" are nothing but stimulants and not advisable to be fed regularly. Egg-More is not a strong tonic and stimulant, but merely contains enough condiments to give the food relish and keep the fowls in fine fettle. It will pay its cost many times over in the increased egg yield. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

Coulson's

No. 3

Condition Powder

For POULTRY

If you are not already using COULSON'S NO. 3 CONDITION POWDER, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season. If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

WE CLAIM

COULSON'S No. 3

Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in. We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are beginning to molt heavily, their combs are as bright and red as at the beginning of the season. You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably. Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want. Where the local dealer does not keep it, we will make you a SPECIAL OFFER to deliver it freight prepaid to any Railroad Station in California, at the following prices:

10-lb Package, \$1.50; 25-lb Package \$3.25;
50-lb Package, \$6; 100-lb Package, \$11.

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

GET SOME NOW AND INSURE YOURSELF
LOTS OF EGGS WHEN PRICES ARE HIGH.

Petaluma California

feeding. The locality and whether the fowls have free range or are confined to runs must also be taken in consideration. Range fowls generally get sufficient food and in such variety to keep themselves in a vigorous state of health, but if there is slowness in the new feathers coming in, or they appear dull and not bright and snappy as they should, or if the fowls appear weak, there is evidence that the food is insufficient in either quantity or quality, or both. A healthy fowl properly fed should show no ill effects from moulting. This is a natural process, and as the hens stop laying during the moult they drain on the system from growing new feathers should not be much greater than from laying eggs. But it is easily seen that to produce a good coat of clear, bright plumage the fowl must have as careful feeding as when laying eggs. Perhaps there should be better care in the matter of feeding during the moult than during the laying season for the reason that the fowl puts on a coat of feathers but once a year. A mistake then in the feeding at this time might mean loss for the entire season, while a mistake in feeding during the laying season may be corrected with comparatively little loss.

A Good Coat.

What is wanted to produce a good coat of feathers is a ration that comprises all the elements necessary to produce a proper growth of good healthy flesh. In growing new feathers the fowls are in need of much the same materials as the growing chicks. There should not be an excess of heating and fattening foods, such as corn and cooked vegetables. Many make the mistake of feeding an excess of cooked vegetables such as potatoes. These are all right, but must be fed in moderation. Give good sound grains, such as oats, wheat, barley, speltz, millet, some corn and bran. The latter is excellent for the fowls at all seasons of the year. In addition to the grains, sunflower seeds and oil meal may be fed frequently, as these contain the materials that give the rich gloss to the plumage so much desired in many varieties. Plenty of green food is also of vast importance at this time. Without green food it is very difficult to keep the fowls in a healthy condition. There is an abundance of it at this season and no one should experience difficulty in keeping his fowls well supplied with this much needed article of food. Meat food is also essential. Fresh meat is about the best, if it can be obtained strictly fresh at a figure that will make the feeding of it profitable. Next come green cut bone and beef scrap. The bone must be freshly cut and care should be exercised that scraps of meat that may cling to the bones have not become tainted. The beef scrap should be the best that can be bought. All meat foods should be fed in moderation until the fowls become accustomed to them, as an excess of meat is almost certain to cause bowel trouble.

Effect of Food on Color.

In white varieties certain foods have a tendency to produce off-color. Yellow corn gives a creaminess to the feathers and should be fed with great moderation during the time the fowls are growing their new feathers. White corn is to be preferred for this reason. Breeders differ somewhat on this point, and the individual breeder must largely act on his own judgment. If experience has taught him that a certain food ration gave good results, that is the ration for him to adopt permanently. If a certain food has been found to have an undesirable influence on the color of the plumage, it is showing the part of wisdom to discard that particular food.

In this connection might be mentioned the fact that the sun has an influence on the color of plumage and fowls that are exposed to the hot rays of the sun during the entire day are not likely to show as good plumage as those that have plenty of shade. Poor color in the plumage should not be attributed to the food when proper shade has not been provided.—L. B. Gardner, in Successful Poultry Journal.

Bees and Their Care

AS TO VARIETIES.

THE instance of voting on various races of bees cited recently by Mr. Horn in the columns of the Cultivator, raises several interesting questions or themes that might bear further discussion. It is not surprising that the very conservative mountain peasants of the German cantons of the little Swiss Republic should be partial to the German bee. I say, not surprising, for here perhaps, if anywhere, the brown bee obtains more nearly in its purity. Further than this it is to be noted what Mr. Horn says in reference to the careful reeding of these bees by the thousand by experiment stations through series of years, all the while keeping in mind a definite type with which each generation was compared and those not measuring up destroyed. This, it will be readily seen, has evolved a carefully selected type, bred from the bees originally found in process not unlike the development of the so-called golden Italian bees of this country from the leather Italians, the true bees of Italy. We have the paradox of this misnomer coming out in the extremely ludicrous position of Italian beekeepers importing from America so-called Italian bees— a reality some product of the indiscriminate American queen rearers.

That the German, brown or black bee as it is more commonly called in this country, should be hardy in Switzerland is perfectly natural from its mountain environment—long winters, short summers, sudden storms, particularly wind storms so destructive to bees, etc. They are free from disease because of their isolation. They are good honey gatherers; because of the short season for flowering plants. All of these, it is to be noted with interest, the similar conditions which have influenced the development of the Carniolan or Krainian bees as Mr. Horn calls them. He living the German or Slavic name. It is further to be noted that they receive the next highest number of votes, receiving twice the number that Italians do, the latter being a race totally unfit for rigorous northern or mountain climates. They are unfit, because of their lack of quietness on the combs, inherent vitality and their tendency to spring-dwindling.

It is true that black bees cap their honey white, perhaps whiter than any other known race of bees. The reason is very simple. They are not good honey gatherers as many other bees may be called even lazy. Consequently, they cap their cells of honey before the cells are full, possibly only three-quarters or two-thirds full. The honey does not reach the capping as a result and the extreme whiteness in appearance follows. Bees more energetic fill their cells brim full and in capping add more and more honey up to the very last opportunity so that when the cells are completely capped, a watery appearance is a result, this due to the honey touching the cappings.

This leads us into the very interesting discussion of why beekeepers are prone for the sake of the almighty dollar, to continually cultivate in their customers these abnormal standards of judgment. If the beekeeper

happens to be a comb-honey producer he caters to whiteness of appearance, rather than full measure and quantity of honey in his pound section. Truly, these are whited sepulchers which outwardly appear beautiful but inwardly, in this case, are not as full as they should be. If the beekeeper happens to be an extracted-honey producer he extracts his honey before it is capped. Why, so that he may on the one hand selfishly save himself the labor of uncapping his honey and on the other hand so that he can hand out to his customers a "water white" product—watery indeed—of a very inferior quality of flavor. He gets more honey, because it is part water. This is a field where it might be well for the pure food law to at least investigate. It is easier, because he does not have to uncap it, and more unsalable because he caters to color and not to quality, thereby developing in his customer an abnormal and false standard of judgment.—Ralph Benton, Berkeley.

VALUE OF BEES TO THE FARMER.

The honey bee is one of the most useful insects to man if he does not occupy the first place. Many farmers think only of honey as the beneficial result of the bee's labor, while some others would consider beeswax well worth mentioning. As these are the considerations which usually lead to bee culture, we may consider the subject from that standpoint in connection with local conditions.

Some honey produced in Stanislaus county is of very fine quality, while some honey, especially that produced on the rivers, may be quite dark and of poor flavor. It is my opinion, based on several years' observation and experience that there is more profit in honey and wax production on a good river range than in alfalfa localities several miles from the river, as the honey flow is usually more reliable, although the honey does not sell so well.

This is not a gilt edged bee country on account of our very windy weather and the early cutting of alfalfa, one of our best honey plants; but it may be conducted with profit as a branch of diversified farming. Under present conditions no one can expect to make the profit in bee culture that some are doing with dairying and fruit raising.

Pollen Distributor.

The economic importance of the honey bee to the general farmer as a pollen distributor—as an aid to the fertilization of flowers—far overshadows the products of the hive. By a wise provision of nature many insects carry pollen from flower to flower, thus insuring perfect fertilization of flowers, and easily the best insect we have for the work is the honey bee. Some say his harmonious work is the result of chance, others say that it is a result of evolution and mutual need between plant and bee, while it is also contended that it is directed by Creative intelligence; but all careful students of the book of nature must admit the fact and deal with it as such. In the westward march of civilization across the United States the orchardist has at times out-traveled the honey bee, but he had to wait till the bee overtook him before he could get full pay for his toil.—W. A. H. Gilstrap, in Modesto Herald.

The Home Tool Kit

When you want a hammer or a hatchet or any tool for any work, you know and everyone knows that the right way to be sure of satisfaction is to order Keen Kutter tools.

But when you want a complete set of tools, instead of buying one tool at a time and never having the right tool when you want it, order one of the

KEEN KUTTER TOOL CABINETS

Every tool has its own place in the cabinet and every tool belongs to the famous Keen Kutter brand, which means they are the best you can buy and that they are guaranteed perfect. Keen Kutter Tool Cabinets are made in various styles and sizes at prices ranging from \$8.50 to \$35.00.

General Agriculture

GOOD TASTE FOR FARMERS.

AS A RULE, whatever pleases pays. Men and women readily sanction a larger profit on luxuries than they do on necessities. The actor who entertains has a larger salary than the teacher who instructs, and when it comes to eatables the same underlying principle prevails, for the eye must be pleased as well as the palate. The highly colored apple which can be "shined up" by the Italian or Greek fruit vender on the street corner, has a virtue all its own in its money making power. Take the same basket of cherries and note the difference in the price they will command when thrown in helter-skelter into a basket and when they are packed with infinite care and exquisite taste. The clean boxes decorated with filigree and tinsel have not a little to do with the profitable sale of its fruit contents.

A pertinent suggestion is made to the Statesman of Salem, Ore., with regard to the potato. It is a habit of the average farmer who has potatoes to market, to dump them unassorted into any sacks he may have on hand, whether clean or dirty, whether patched or ragged. The suggestion is made that it might add materially to the price received if potatoes were well assorted and packed in boxes of convenient size.

One up-to-date farmer's wife, who has picked customers in Spokane, has been in the habit of bringing them cottage cheese with her butter and eggs. Recently she adopted the practice of weekly packing this cheese in small paper buckets the same as are used by the venders of ice cream, pickles, etc. Each of these little packages she sells for a nickel. At first thought it would seem that this woman would have enough to do as a busy farmer's wife without going to all this trouble to sell bits of cottage cheese, but the nickles count up, and her customers are pleased and buy readily. The same trait leads her to adopt the most approved styles in marketing other products, and when she comes into town with a fine span of driving horses there is everywhere about her the air of prosperity. This woman is doing her part in raising farming from the low level of unprofitable drudgery to the high art of an enviable vocation.

No calling in life lends itself more easily to artistic influences than that of farming. Art means dollars to farmers. There is no question about it. The time may yet come when every live farmer's organization will have its art department in charge of an artist who shall spend his time in making designs, and suggesting ways of packing fruits and produce and preparing effective advertising matter. These industrial artists are to be found everywhere in manufacturing and commercial circles. The makers of wall paper, of carpets, even kitchen utensils, are ever seeking designs which will please the eye of their customers, while the average farmer goes on his way, never dreaming that the same principle lies at the basis of his own prosperity.

The man who imports horses at a great cost from Europe knows the value of "dressing" his animals for sale. The grooming and braiding the

mane and tail and the artistic use of ribbons and rosettes have much to do with big prices, and even the time horse trader, in his primitive fashion, understood the value of slicking up the wornout animal, passing him off at a big price. Spokesman Review.

"THE CALIFORNIA VALLEY."

We have long needed a name for the great central part of California included in the San Joaquin and Sacramento valleys. The official name "San Joaquin valley" and "Sacramento valley" in the first place designates two valleys what is really one, and in the second place, the word "valley" in California refers generally to a small basin immediately surrounded by hills, while this great plain is a domain of itself, including the largest part of the habitable area of the whole State. The war bureau brought out a few years ago the phrase "the great valley" which was acceptable for California use, but was not sufficiently specific for a general name. Gifford Pinchot in a speech in Sacramento Saturday hit, apparently quite unconsciously, on a better phrase. He spoke of "the California valley." That hits exactly. It is sufficiently specific and yet sufficiently general. It would instantly suggest the right idea whether used in Cape Town or in San Francisco. Used outside of California, it requires no separate qualification to show that it is the great central plain of California, rather than of some other region to which reference is had. Used in California, on the other hand, it raises no doubt which California valley is meant. There can be but one "the" California valley. And the very use of the definite article serves to preclude the misconception that this valley is only one among other California valleys. The Santa Clara valley is "a" California valley; chief, in fact, in the "a" valley class. But this valley is "the" California valley, not because it is bigger and better than the others, but because it is absolutely out of their class. "The" California valley includes most of the State and is the central and dominating fact of the State. "A" California valley, known by the name of one or another of the minor rivers, is simply one or another fragment of the remaining fraction of the State. They are fair gems upon the diadem of California. But "the" California valley is the head upon which diadem and gems are set. So suppose we take this chance phrase of Pinchot (if it was chance) as our official designation, and refer to the great plain included in the San Joaquin and Sacramento valleys as "the California valley."—Fresno Republican.

The Hanford Sentinel says that when it comes to grapes that grow on vines, Kings county takes a back seat to no one. There are now almost 114,000 trays of grapes drying on one ranch under the Kings county sun.

Raisins are said to be drying away less this year than usual. Many claim this is due to the cool weather which is over the San Joaquin valley this season.

Irrigation and Forestry

THE RIVER IMPROVEMENT ASSOCIATION.

THE River Improvement and Drainage Association of California, which has done effective work in bringing about a betterment of conditions so far as improvement of the rivers of California are concerned, is in receipt of supplemental report from Major T. G. Dabney, who headed the Dabney Commission of Engineers which thoroughly investigated the Sacramento and San Joaquin rivers in 1904, as a result of the work of the association. After speaking of the high degree of intelligence noted among the people of the California valley, Major Dabney says:

"There can be no doubt that such a class of population as we find here must succeed in any enterprise they may embark upon if only they shall put it together and in harmony, which means thorough organization as first requisite to success."

It was the thorough organization of the River Improvement and Drainage Association of California which enabled it to bring about results which are now benefiting the great valley. The Sacramento Drainage Commission, now in active operation, and declared legal and competent by the courts, is one of the results of this organization, and the mass of statistics and data relating to the rivers which has been gathered and is ready for presentation to Congress, and the further work along

this line which is in progress, shows that the association is not only organized but is thoroughly alive and active in its work for the betterment of river conditions.

After going into detail regarding the work of reclamation and drainage in the Yazoo bottom lands of the Mississippi, Major Dabney shows that it is not necessary to have the vast sum of many millions on hand before work is begun, but that in California it can be accomplished if the recommendations of the Commission of Engineers, of a joint appropriation of \$800,000 by State and Federal governments, be properly applied, and with this beginning the improvement will be permanent and progressive. It was the opinion of the Commission of Engineers that it would require a total of \$23,000,000 to reclaim the entire Sacramento valley.

The River Improvement and Drainage Association of California has worked persistently but quietly, ever since it was organized in May, 1904, and many benefits that have come to the rivers are the direct result of this work which is still going on and which is still accomplishing much good. The association is composed of men who look more to the benefit of California, than to their own personal aggrandizement, consequently the general public has heard little of the organization. It was started by a mass convention in San Francisco at which all of the prominent com-

mercial organizations of the State were represented, and since that time it has lost no opportunity to carry out the plans suggested by the Dabney Commission of Engineers which it was instrumental in having formed.

Forests regulate the flow of streams, prevent erosion and turbidity and make waste areas beautiful and productive besides insuring a source of pure water supply. Wherever natural reproduction cannot be depended upon to cover the denuded and burned-over lands of most of these watersheds, tree-planting operations must be undertaken. While the immediate object of this reforestation will be protective, timber crops will eventually be produced which will yield good profits on all such investments.

Forests and irrigation are perhaps more closely related in California than in any other part of the United States. Without water for irrigation the State's agricultural resources would be small. Water is supplied largely from melting snow in the mountains during the spring and summer; and the wooded areas protect the snow, allowing it to melt and reach the streams gradually. Any threatened diminution in the water supply is necessarily viewed with alarm by owners of orchards, vineyards, gardens, hay ranches and pastures and by all who depend so largely upon these industries.

California has an excellent State forest service, but the people are awake to the necessity of further improvement. They likewise appreciate the fire protection afforded by the

forest service officers of the government in the National Forests and the grazing regulations which prevent pasturing the woodland ranges to death. Remarkable improvements have resulted in forest conditions in the past ten years under protection of the government and the State. No one there is now heard to voice a desire to go back to the old way.

There was a little chap who refused to be a "country-weeker." He would stay in the city. No country for him.

"But why?" he was asked. "Because they have thrashin' machines out there," said he, and it's bad enough here, where it's done by hand."—National Farmer.

I would like to point out that you can never get the right kind, the best kind of labor, if you offer employment for only a few months, for no man worth anything will permanently accept a system which leaves him in idleness for half a year.—Theodore Roosevelt.

We hope ultimately to double the average yield of wheat and corn per acre; it will be a great achievement; but it is even more important to double the desirability, comfort and standing of the farmer's life.—Theodore Roosevelt.

Our Northern California representative writes:

"Vacaville has a fair peach and pear crop which has received a big price."

He also adds that the Cultivator is a favorite in Vacaville, Woodland and nearby towns.

For Winter Tomatoes Citrus Fruits Poultry and a Foothill Home

We have about 200 acres of frostless foothill land with water developed and piped to the land, lying within sixteen miles of Los Angeles, at

Only \$150 an Acre

This land is open at this price for a short time only in connection with the sixth big Home Extension Colony which we just formed and located upon land adjoining this.

There are proper reasons for the low price:

First.—We buy and distribute at low wholesale prices.

Second.—This land now lies a mile or two back from the railroad where little development has been done. It is northeast of Burbank, beyond the first foothills.

Listen to this:

It is as pretty as Altadena or Sierra Madre country (elevation 1100 feet) as rich as our best valley lands. It lies on foothill slopes so that you can buy valley land at above prices and good hill land (for eucalyptus) or bee pasture immediately to your rear, at only \$22.50 an acre.

We know of no better orange or lemon land, and seriously urge your immediate investigation. Water duty, one inch to five acres at rate of one cent per inch per hour.

Send for literature. Or better, call here any day at 2 o'clock p. m. and go see the land at once. Round trip only \$1.25. No Sunday trips.

This cannot last at these prices over two or three weeks and you better come and get first choice of something as pretty and as valuable as the Southland affords.

California Home Extension Association
Chamber of Commerce Building, Los Angeles, California

THE GOING OF THE GREEN.

In the going of the green and the coming of the gold
The tender nature story by the mead-ow brooks is told,
The little hill discloses and the little field reveals
The gradual incarnation that across the country steals.

The green, the green is going, but the gold is marching on,
With Major General Goldenrod as vanguard of the dawn,
And every weed a blossom and every bloom a ray
Of purple or of amber in a color scheme of gray!

In the coming of the gold and the going of the green
The gentle art of harmony in nature's way is seen—
For Beauty's ever there, on unfet-tered wings it ranges,
And it's only that its color and its form and fashion changes!
—Baltimore Sun.

WHO ATE THE RING?

HAROLD was having a birthday party because he was six years old, and Aunt Helen and Grand-ma and Miss Nellie, and ever so many big people were there helping all the little people to have a splen-did time. They played games and sat in the darkened parlor to look at the magic lantern pictures till the clock struck five, and then Harold knew what was coming.

Out in the dinging-room the table was set with mamma's - prettiest china, and there were candles and flowers and bon-bons just like a grown-up party.

Harold was very anxious to have all the children see the table, so he was glad when Aunt Helen said: "Now we are going to march to the dining-room."

Miss Nellie played a bright little march, and the boys and girls formed a long line through the parlor and out on the piazza. "Just like a long white ribbon," said Grandma, for most of the girls wore white dresses and the boys white waists.

The tiny sandwiches and wee pic-kles vanished like magic and all the grown-up people were kept busy waiting on the little folks. Playing games makes one very hungry, you know, and most of the guests had been too excited to eat much dinner that day. Altogether it was a very jolly supper, and when mamma wanted to make a little speech she had to ring the tea bell several times.

"Now children," she said, "I am go-ing to pass some little cakes and one of them has a ring baked in it. You must eat them very slowly and care-fully, so some one does not swallow it. You must not break up the cakes to find the ring but just nibble away till some little boy or girl says, 'I've got the ring.'"

Aunt Helen brought in ice cream and the children ate the cakes and the cream very slowly. At last all had been eaten and still no one had said, "I've got the ring."

"That is very strange," said mam-ma. "I will ask Mary if any one took one of the cakes."

"No ma'am," said the maid posi-tively. "There has been no one but me in the dining-room since I put the cakes on the table."

"I just know I swallowed it," sobbed a little girl. "I felt it going down."

"So did I," said a tiny boy, and he had to cry too.

"There! There!" said Mrs. Clifford

much perplexed. "Two of you could not have eaten it, so don't cry."

"I feel bad, too," said another little girl. "It must have been in my cake."

I really don't know what would have happened just then if papa had'n't come in. He was so surprised to see tears at a birthday party that he had to inquire the cause, though he was in a big hurry.

"Well, well," he laughed. "I didn't know what a commotion I would cause by taking one cake. I was on my way to see a little patient who has been in bed a long time with a lame limb and I wanted to take her some of the goodies. I slipped softly in here a little while ago and took some of the nice things without dis-turbing the party a bit. Even Mary didn't see me. Now, I just wonder if little Bess Ryan isn't wearing that ring this minute?"

"O, papa, won't you go right over and see?" begged Harold.

"I hope she did get it," cried all the children and sure enough, in a few minutes, Doctor Clifford came back to tell how happy the little girl was with her treasure.—Scattered Seeds.

ALL SMILED BUT THE EDITOR.

A fine plump fowl arrived at the office of a Fleet street weekly a few days ago by parcel post. Each of the sub-editors had made up his mind to annex the bird, but these hopes were cruelly disappointed by the editor himself, who, having espied the winged one, and regarding it as one of his rightful perquisites, promptly took it home and dined off it.

The following morning a letter came to the offices from a "Constant Reader." It ran: "Dear Mr. Editor: By an early post I sent you a chicken. It has been the source of much dis-cussion among a few of us, and we have decided to let you settle the dis-pute. What we want to know is: What did it die of?"

The editor has gone on a sea voy-age to try and get over it.—Poultry Advocate.

SENTENCE SERMONS.

Sorrows give strength.
Flattery makes no friends.
Soft soap washes no hearts.
Looking at sin leads to loving it.
Love is never afraid of overwork.
It doesn't take any grit to grumble.
The angry man always lashes him-self.

Religion for reward would be sin for a raise.

A bed of roses soon wears down to the thorns.

The sure sign of a fool is that he forgets his folly.

Nothing enriches the world more than a happy face.

He who dwells on his troubles al-ways dwells in them.

A warm handshake may do more than a cold handout.

You never lose any of your sorrow by shedding sour looks.

One realizes the impotence of money when he tries to buy love.

Your conscience must be a light to you, but cannot be a law to others.

HIS FACE HIS FORTUNE.

Knicker—"Strange they didn't name the baby after its rich uncle."

Bocker—"No; he looked at it, and said he'd give them \$10,000 not to."

HOW TO HANDLE DOGS AND BABIES.

The following paragraph will be highly appreciated by the mer mother:

"A toy dog requires to be handle with as much care as a baby. Some people take them up by their legs. That is as cruel as it would be to take a baby up in the same manner." —M. A. P.

Of course, the proper way with babies is to lift them by the loose skin at the back of the neck.—Punc

HOMELY HINTS.

Washing machines are not especially modern inventions but the latest version of this labor-saving device has a patent hose attachment by which even the labor of filling the machine with water is saved. The machine is simply placed in the vicinity of a water faucet, the hose connected with the faucet and the water turned on. There is a second length of hose by which the water can be emptied.

When washing handkerchiefs put a small muslin bag containing a littleorris root in the water in which they are boiled. This will give them a faint, but agreeable scent when ironed. If borax is added to the ironing water it will give the sheer handkerchiefs a little body without making them harsh as when stiffened with starch.

Then when ironing the handkerchiefs an excellent plan is to fold all worn or ragged ones in a three-cornered shape, while those that are in perfect condition may be folded square. If the members of the household are taught the significance of the different shapes they will often be saved from the embarrassment of opening up a ragged handkerchief, which was apparently respectable when neatly folded.

A wet sheet hung in sickroom or workroom helps to cool the air.

At bedtime or before dressing, fresh in the afternoon take a warm sponge bath, which will give by reaction the most delicious sense of coolness. Cold baths in the morning invigorate and arouse the circulation.

Jardinières or bowls of fresh water set about in the different rooms and often refilled help to keep the house cool. A few drops of rose or violet water or a rose geranium leaf may be added to make a pleasant scent. This is particularly grateful in an invalid's room if the odor happens to be a favorite.

Cool all food and drink in the refrigerator, not by putting cracked ice to melt on butter, salads or relishes or in cold beverages. One can never be sure that ice is absolutely pure and very often it is not even clean, so that dangerous germs may be liberated in the melting process.

Cut down on fat in cooking while the thermometer is high. Starchy

and sweet foods also produce heat. Salads, lean meat and fruit should replace hearty dishes and rich desserts.

When the ice gives out unexpectedly, the butter may be kept hard by putting it in a deep covered bowl inside a pan of cold water. Over the cover spread a towel so that the corners will hang down into the water, and if the room is reasonably cool the butter will be firm when taken out.

RECIPES.

Potatoes in Cream.

Melt a tablespoonful of butter in a frying pan and add one pint of chopped cold boiled potatoes, seasoned with salt and pepper. Stir until evenly coated with butter, then pour in slowly a cupful of thin cream, until it is almost absorbed. A few tablespoonfuls of minced chicken or ham may be added. Cream is a very valuable and by no means extravagant article of diet, particularly for those who live in the country.

Ham and Potatoes.

Mince fine a cupful and a half of cold boiled ham, and slice thin an equal quantity of boiled potatoes. Arrange in alternate layers in an earthen dish, seasoning with salt and pepper to taste. Pour over these a pint of white sauce, sprinkle thickly with bread crumbs and brown in a hot oven.

Summer Squash.

A very young squash is called for, and if it be young enough, there will be no necessity even to pare it. Cut in very small pieces. Cut up also a slice of onion and fry brown in a little lard. Put in the squash and a little salt and pepper; fry for about ten minutes and pour in a fourth of a cupful of hot water. Cook until the squash is soft enough to mash with a spoon.

A good friend of the Cultivator sends, the following original recipes for the Household Department.

Here are two of the little trifles that help out at the table, if these are served first they can be already on the table when the family or guest enter the dining room. These two are particularly refreshing before clam or beef bouillon, or before any of the thin soups. These are not sufficiently

Do you Shave? Don't be satisfied with poor soap. Washing soap, toilet soap or even the best Castile soap are not suitable for shaving. It requires a soap made especially for the purpose to soften the beard and prevent irritation.

The thick, creamlike lather of Williams' Shaving Soap does this as nothing else will. It has been the standard for 60 years.

"The only kind that won't smart or dry on the face."

Send 2c. stamp for a TRIAL CAKE of Williams' Shaving Soap, or 4c. for a Williams' Shaving Stick, trial size, enough for 50 shaves. Address

THE J. B. WILLIAMS COMPANY

DEPARTMENT A, GLASTONBURY, CONN.

acid to serve before a vegetable puree or a heavy thick soup.

Grape Compote.

For five people: Peel twenty or thirty large grapes, cut a tart apple into fine slivers, add ten halves of canned apricots put through the colander to remove skins and strings; pour over it all half a pint of grape juice, add juice of a lemon, two teaspoons of sugar, a full teaspoon of celery salt, a pinch of cayenne pepper and a pinch of ordinary salt. Serve cold in high glasses, put a grape leaf in the plate, instead of a doily if they can be readily obtained.

Grape Compote With Cream.

For five people: Cut an apple into slivers and cover it with the juice of a lemon, a pinch of salt, a teaspoon of sugar, add twenty-five skinned grapes and five tablespoons of heavy cream, stir all together and serve in the high glasses. Chop lettuce into long slender pieces or use chicory in the glasses and put the apple and grape compote on top.—M. E. S.

CONTENTMENT.

A little farm, well-tilled—
Some sixty acres, say;
A little home, well-filled
With children, bright and gay;
A little wife, well-beloved,
To help one work and plan;
A little Paradise below—
What more need any man?

QUIT.

Saying that fate is against you.
Finding fault with the weather.
Taking offense where none is intended.
Dwelling on fancied slights and wrongs.
Talking big things and doing small ones.
Scolding and flying into a passion over trifles.
Boasting of what you can do instead of doing it.
Thinking that life is a grind, and not worth living.
Talking continually about yourself and your affairs.
Depreciating yourself and making light of your abilities.
Saying unkind things about acquaintances and friends.
Exaggerating and making mountains out of molehills.
Lamenting the past, holding on to disagreeable experiences.
Pitying yourself and bemoaning your lack of opportunities.
Comparing yourself with others to your own disadvantage.
Thinking of yourself to the exclusion of everything and everyone else.
Waiting round for chances to turn up. Go and turn them up.
Writing letters when the blood is hot, which you may regret later.

LOW ALTITUDE—Irrigated lands on easy terms in this long established fruit colony. Water piped to every tract. Just write for pamphlet 119, or send 15c for panoramic photograph. 8x36 inches, post paid in tube. Address, DEVELOPMENT LEAGUE, Lewiston, Idaho, or Clarkston, Washington.

IRRIGATED ALFALFA, SUGAR BEET and grain land, \$18 to \$25 an acre. All the water you wish guaranteed by Canadian Government for 50c an acre a year. Good markets. Highest crops. W. R. GILSON, 411 S. Main St., Los Angeles.

The Produce Markets

Los Angeles Markets

LOS ANGELES, Oct. 2, 1907.

Butter.

On the butter situation a local paper says:

"The butter market is in a very unsettled state. There are numerous rumors of changes that are to occur among the large butter interests in the near future, and if they come to pass the entire butter supply of Los Angeles will be controlled by one great trust with the exception of one more or less important firm. Undoubtedly this would mean the highest priced butter the city has ever known."

It's the multitude of little things that make up the sum of living, and the way they are done makes life either pleasant or unhappy. Shaving is a small thing and yet if it is not done properly it is the cause of a great deal of discomfort, and, in cases of extreme carelessness—positive pain and danger. It stands to reason that a soap which will bite resin and grease off the kitchen floor, is not the sort of thing to use on the face. Those who use it for the latter should not be surprised at having a burning, itching face—William's Shaving Soap is made for one purpose—Shaving. It is a guarantee of comfort and safety.

By sending a 2c stamp to the manufacturers, the J. B. Williams Co., Glasstonbury, Conn., to pay postage, you can obtain a free sample.

VALUABLE.

I find the Cultivator a valuable paper.—E. A. Connell, Watsonville.

A sheep owner at Pomeroy, Washington, finding himself unable to secure cars to transport his sheep to market has arranged with a farmer to keep fourteen hundred head until spring and for the service gives the spring clip of wool.

San Francisco Markets

SAN FRANCISCO, Oct. 1, 1907

Butter.

Butter is in very heavy receipt; the market has absorbed it well, and even advanced a cent since last week. Prevailing sentiment is that no decline will occur.

Vegetables.

The vegetable market dragged yesterday and a large carry-over of many varieties made trading weak. Buyers were slow to make offers on the unsalable stock and fresh supplies arrived too late in the day to serve the early buyers. Tomatoes were plentiful, but the large carry-over Saturday, was in poor condition and dealers shaded quotations accordingly. Green peppers are coming in steadily and meet with a better call than previously. There is no marked change in cucumbers and onions seem to be moving slowly.

Fresh Fruits.

Fruits quiet, supplies coming slowly.

Varieties of orchard fruits are gradually falling off as the season grows late and business is confined to the more staple kinds. Peaches continue to arrive from Oregon in small, choice lots, with buyers few. Figs were in heavy receipt and weak on account of their perishable condition. Seedless grapes are in especially heavy receipt. Bartlett pears are falling off in receipt and the second crop is well disposed of. Nutmegs were poor seller yesterday on account of their undesirable quality. Quinces were in moderately large quantity, with trading weak.

NEW INCUBATOR FACTORY.

Machinery and wood working tools are now being installed in the new factory of the McClanahan Incubator Company, of Los Angeles. This company's business has increased from year to year to such an extent that it is necessary at the present time to employ a good many men to work on the brooders alone. The new incubator will be known as the Success Incubator, as a line of brooders have been made by this company of the same name for some time.

The first machines made by this company were all hand-made and were entered at the Oregon State Fair in the latter part of September and walked away with the blue ribbon.

The first machine to be made will be twenty of the big 600-egg size machines to be used by the Pioneer Hatchery Company, 711 South Main St. A stock of all the machines and brooders will be ready soon, and catalog giving description, etc., will be mailed free to those who ask for it. The prices will be lower than any other factories on the Pacific Coast.

Wala Wala, Washington, claims the largest peaches in the whole country. One grower marketed three boxes which averaged over a pound each, with a circumference of thirteen inches each.

A movement is on foot to form a new reclamation district of about eight thousand acres of land in Sutter and Sacramento counties lying along the Feather and Sacramento rivers.

Ninety-five million bushels of wheat. This is the official estimate of the 1907 crop in Canada's three great wheat-growing provinces of Manitoba, Saskatchewan and Alberta.

SHOULDER GALLS.

During this month and next look carefully to your horses' shoulders, for they are liable to become sore from collar galls. Hot weather, heavy work and ill-fitting collars will surely produce sore shoulders, unless the horses are watched closely, their shoulders washed at noon and at night and the collars and pads cleaned of the sweat which has dried on them. The horse's shoulder should be washed every night after the harness is removed, whether it is sore or not. Galls are caused by a dirty pad coming in contact with a dirty shoulder. If both are kept clean there is but little danger to the shoulder becoming galled. If the shoulder galls, the animals should be turned into the pasture and the gall washed once a day with warm water to which is added a little carbolic acid.

We have an excellent way to clean the harness to work it with a cloth wrung out in kerosene oil. This removes the dirt and any microbes and renders the harness soft and pliable.

TREMENDOUS GROWTH OF MILWAUKEE CONCERN.

Milwaukee can be proud to be the home of the Mayer Boot and Shoe Company. Next to the fame of Milwaukee's great breweries comes the country-wide reputation of Mayer boots and shoes. Mayer shoes have won their reputation on quality. The Mayer Boot and Shoe Company has persistently refused to lower quality to enable it to sell shoes at a lower price, and by maintaining this honest and superior quality, and keeping in the front ranks in style, it has gradually won the confidence of thousands of shoe wearers who purchase Mayer-made shoes year after year—who look at the Mayer trade mark as positive evidence of style, comfort and good wearing quality.

This quality policy so consistently pursued has resulted in healthful and rapid growth. In the twenty-five years since the Mayer Shoe Company began operations it has outgrown six factories. And in the last six months, during which the last factory annex in Milwaukee has been building, the volume of business has so greatly increased that even with this new annex the output lags far behind the demand.

Including the new Seattle factory, which has just been completed, the total capacity of the Mayer Boot and Shoe Company exceeds 9000 pairs a day. This remarkable output, together with the inability of the Mayer Company to build factories fast enough to keep pace with the demand, is most convincing evidence of the high quality of Mayer footwear.

In the first place the Mayer shoes are sensible. While good style is an important factor, comfort is always a greater consideration; while conspicuous extremes are avoided, refined dressiness is always secured. The exceptional durability and splendid wearing quality of Mayer shoes are due to the use of only the best leather and the employment of only the most experienced and skillful workmen. From the wide range of styles you are certain to find one which pleases. The best known brands are the "Honorbilt" fine shoe for men; the "Leading Lady" fine shoes; the "Martha Washington" Comfort Shoes; "Special Merit" school shoes, and the "Yerma" cushion shoes. If you want a dress shoe, a work shoe, or a shoe dressy enough for general use, yet sturdy enough for rough usage, it is our belief that you can't do better than to ask your dealer to supply you with one of the Mayer brands.

While the acreage of beans in San Joaquin county is less by three thousand and acres than last year, it is claimed the yield will be nearly up to that of 1906.

"BUILT on HONOR"

You must wear MAYER HONORBILT SHOES, to appreciate their superiority over other makes. They have the style and wearing qualities, and feel right from the first; wear long and well, and look good to the last.

Mayer
HONORBILT

SHOES FOR MEN

are made with great care, of the highest grade material, by skilled workmen. They are honest through and through. You get style, quality and comfort in buying MAYER HONORBILT SHOES.

Your dealer will supply you; if not, write to us. Look for the Mayer Trade Mark on the sole.

We also make Leading Lady Shoes, Martha Washington Comfort Shoes, Special Merit School Shoes.

Telephone & Electric Equipment Co.,
Seattle, San Francisco, Los Angeles

Does this stream of water look good to you?

It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs.

It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.

How many pump users can say this?

It shows conclusively that it pays to install good machinery.

We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.

Mail us a card asking for it today.

The Date Palm in California

Courtesy Out West

THE growing of dates in California is yet in the experimental stage, but the experiment is proving so interesting that many are taking an interest which is not passive by any means. In fact, it is so active that outside the experimental plantings of the government there are many private holdings which are promising much.

Regarding the government planting at Mecca, B. G. Johnson, the superintendent in charge says:

At this station there are planted twelve acres of date palm trees from six importations, from several date growing countries. The greatest number of trees planted are from Algeria, Tunis, Egypt and the Persian gulf region. There have been all degrees of success, depending upon the vigor of the varieties, the distance transported, the care given on the trip and after having been planted. While not bearing commercial quantities of fruit until about five years old, a number of trees have borne fruit when two years old. This year there are a number of both two and three-year-old trees in fruiting.

Three men are now employed at the station. When the orchard was established three years ago, May, 1904, only one man was employed.

There are many sections of California where the date palm flourishes, especially in the southern part of the State where the rainfall is light. It will flourish in the Mojave desert, Death valley, in the San Joaquin valley and in the Sacramento valley. But humid sections in these valleys should not be selected, as the fruit will not

ripen in a humid climate, especially such as that of Florida, though it is warm enough there for the tree. It will also flourish at Keeler and at Barstow. Ordinarily the trees are planted thirty feet distant from each other, though some are planted at twenty-five or even twenty feet apart. Its yield depends upon the soil and the climate. Under ordinary conditions it bears within four years after the seed is planted and in a year or two more it produces dates in paying quantities—from 300 to 400 pounds or more a year. It is long lived and will bear for a century or two centuries, and even longer. About 40 to 50 per cent is sugar. The Arab sweet date is about 60 per cent sugar.

The date plant differs from an ordinary fruit tree as to the water supply and the climate. There is no other tree like it. Heat is necessary from May to November, the time of fruiting. The mean temperature should be about 75 degrees, and in June, July, August it should be 80 degrees. Where late varieties are desired the temperature should be at least 90 degrees during these three months. This is found in Death valley, the Mojave desert, the Colorado desert, the Volcanic springs and the Salton sea section. There is a thermal belt along the foothills of the Sierra Nevada, adjoining the interior valley region, where the date could be profitably grown, and for commercial purposes. The date is not strictly a desert plant, as is shown by its being cultivated at Berkeley, Fresno, Pomona and other sections of semi-arid California. While its leaves are adapted to stand the driest of climates, its roots must have water, but not as much water as ordinary plants, however.

Coulson's No. 3

Condition Powder ==FOR POULTRY==

If you are not already using COULSON'S NO. 3 CONDITION POWDER, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season. If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

WE CLAIM COULSON'S No. 3 Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in. We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are beginning to molt heavily, their combs are as bright and red as at the beginning of the season. You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably. Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want. Where the local dealer does not keep it, we will make you a SPECIAL OFFER to deliver it freight prepaid to any Railroad Station in California, at the following prices:

10-lb Package, \$1.50; 25-lb Package \$3.25;
50-lb Package, \$6; 100-lb Package, \$11.

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

Common Schools and the Farm Youth

Prof. L. H. Bailey, Director of the College of Agriculture
of Cornell University, Writes of Present
Day Demands in Common School Work

A series of papers in the Century Magazine Prof Bailey is giving some excellent reasons for certain changes in our educational system, especially with reference to common schools of the country.

Regarding the problem facing the country schools, he says:

"Sympathy with any kind of effort or occupation, and good preparation for engaging in it, are matters of slow and long-continued growth. This growth should begin in childhood and should be aided by the home and the school. The country school carries a greater responsibility than the city school, in proportion to its advantages, for it is charged not only with its own country problems, but with the training of many persons who swell the population of cities. The country school is within the sphere of a very definite series of life occupations."

As to the objects of nature study, the writer includes:

"The end of nature study is to develop spiritual sensitiveness and insight; therefore, it must not deal with mere objects and phenomena. In this it differs from the prevailing conception of science teaching. I think that I catch this note in the syllabi and books that I have examined. His attitude accepts phenomena as real, and regards what we call 'progress' to be really such. It accepts the world as good. It does not deprecate the need and importance of introspection, it regards introspection and meditation as exercises for a mature and maturing mind, and holds that such exercise is most effective when most closely related to experience. Nature study is not merely objective if it is developed in the way in which it should be developed. If we develop first the meditative, passive and subjective habit, then we are oriental; but the spirit of the West is to live actively with the world."

Results To Be Expected.

Persons are always asking for the results of nature study work, as if they expect that statistics can be given in reply. They want to know how many teachers are teaching it, how many children are interested in it, how many school gardens there are, how many syllabi are in use, how many pupils are enrolled and the like. All this is well in its way, and is important, though the results of nature study are not to be measured by these formal means, but, rather, by a general elevation in the mode and tone of the school, and in the point of view of the community. The school must be reorganized to meet the child's needs. It must be simplified. Subject must be taken out, rather than put in; whatever subjects remain, the nature study philosophy and point of view must run through them all, for it is a fundamental educational means. Most of the criticisms of nature study are made against what are thought to be faulty methods here and there. It may be a question whether these criticised methods really are faulty; but even if they are, and if all the work has been inadequate, nevertheless the nature study movement will abide. It is one expression of the new education.

If this experience teaching is so fundamental, we must not look for results quickly. Spiritual movements proceed slowly. It may require a

generation yet to get us out of the habit of teaching merely the names of things.

It has been said that the current movement toward nature study is misdirected, since all human activities, of whatever kind, proceed from experience. Language, for example, is only a means of expressing experience; therefore, Greek study is nature study. However, the evolution of a language is the experience of a race; what we now argue for is the using of the experience of the individual. Of course, no one would advise against the use of race experience, as expressed in language and literature; but education should begin with the person, which is the concrete.

It is a fallacy to consider that nature study must be merely correlated with the present school subjects except as a means of starting and establishing its spirit. Nature study teaching is a way of conducting the school work so that it will have personal application and meaning.

The school must be given a new purpose or expression. Our school systems are now really developed for the few—for those who are good "scholars." Other pupils are expected to emulate these few, whereas they may have a wholly different order of ability. When education becomes personal, all this will change. Well developed experience with one's normal environment is nature study; it lies deeper than the adding of a subject to the course, deeper than merely to be "correlated with." It is quite the opposite of "correlation with," as if it were applied from the outside; it is giving direction to, making application of.

Application to the Country School.

Just now nature study is the stepping-stone to the introduction of agricultural studies. This is an indication that it is a means of connecting the school with the real life and activity of the community; but nature study is a means of preparing the pupil for all kinds of school work and for all places, as well as for agriculture and for the country. It is a redirecting agency. In time, as the schools develop, we shall find that we shall not need to introduce agriculture as a separate study, even in rural districts, at least not below the high school, for in such districts the whole school effort will have an agricultural, country life or nature study trend.

Lest I be misunderstood, I will say at once that I am not opposed to the introduction of agriculture as a separate study into the elementary rural school. In fact, such introduction may be the very best means of bringing about the deeper and more fundamental redirecting of the school that is essential to its full effectiveness. I look on the separate teaching of agriculture as a present means to an end. We should not lose sight of the fact, however, that the schools are actually being redirected much more rapidly than those not engaged in school work may be aware.

In time, the beginning schools will probably not teach any of the present-day subjects under their present names; but this will adjust itself into the natural course of evolution. The greatest need is to reorganize the teaching of the subjects that are already in the country schools. Geography, for example, will deal first with the local

country and its affairs. Of course, the methods have changed greatly in a generation; but the old geography was largely of the ballooning variety, beginning with the universe and descending through the solar system to the earth.

All this is rapidly changing. If the school is in the open country, it may give attention to fields, birds, soils, brooks, forests, crops, roads, farm animals, hamlets and homes. Geography can be so taught in the schools as, in ten years to start a revolution in the agriculture of any commonwealth.

Arithmetic needs redirecting in the same spirit. The beginnings of a new motive in it are now becoming prominent. The principles of number are the same wherever taught, but practice problems may have local application. These problems have heretofore dealt with theoretical, urban, middleman, copartnership subjects and sometimes have been mere numerical puzzles. It is significant that the arithmetic problems that the country child takes home do not interest the old folks. This is only because the problems mean nothing to them. Many of the problems of the farmer are numerical—soil moisture, fertility, questions, feeding rations, spraying, cost of labor and of producing crops, and all the manner of accounts. Numbers can be taught in the schools as, in ten years, to start a revolution in the agriculture of any commonwealth.

Reading needs similar reorganization. This is everywhere recognized, and distinct progress is being made. It is not desirable to eliminate the customary types of literature of the masters; but something may be added to make the reading vital and applicable. It is not difficult now to find good pieces of English composition that deal with the customary practices and affairs of the open country, and that point the way to better things. Reading and spelling can be so taught as, in ten years, to start a revolution in the agriculture of any commonwealth.

Touches Country Life.

Even manual training needs new direction as it touches country life. It may not be necessary to eliminate the formal exercises of model work and weaving and the like, but some of the practical problems of the home and farm may be added. How to make a garden, to lay out paths, make fences and labels, are manual training problems. How to saw a board off straight, to drive a nail, to whittle a peg, to make a tooth for a hand hayrake, to repair a hoe, to sharpen a saw, to paint a fence, to hang a gate, to adjust a plowpoint, to mend a strap, to prune an apple tree, to harness a horse—the problems are bewildering from their very number. Manual training can be taught in the schools that are equipped for it as, in ten years, to start a revolution in the agriculture of any commonwealth.

Better School Buildings.

All such training as this will call for a new purpose in the school building. The present country school building is a structure in which children sit to study books and recite from them. It should also be a place in which children can work with their hands. Every school building should have a laboratory room in which there may be a few plants growing in the windows,

Deciduous Fruit Culture

THE ACTION OF MANURE.

MANURE is the most valuable source of nitrogen. When fresh, the nitrogen it contains is mostly insoluble, and hence not available to plants. But the manure decomposes by standing; that is, the bacteria devour it and set free its ammonia gas, which contains the nitrogen. The ammonia gas is attacked by another kind of bacteria, and is converted into nitrous acid. Then a third kind, which kind cannot begin to work until the ammonia has disappeared, convert the nitrous acid and the nitrites into nitrates, the form in which plants can use the nitrogen. The ammonia gas may escape from the manure into the air and the nitrogen will be lost unless soil is mixed with decaying manure, for soil has a great power of absorbing ammonia, which is then changed into soluble compounds of nitrogen. If air is admitted too freely into the compost, the gases will form too rapidly and will escape. If air is excluded, the decomposition ceases. Water and air in proper quantities produce the desirable rate of decomposition in this fertilizer, which is the best for general purposes.

Prof. Hopkins, of the Illinois Experiment Station, says: "The plant food in a ton of manure varies greatly with the exposure it has suffered under the weather conditions. If ordinary fresh farm manure contains ten pounds of nitrogen, two pounds of phosphorus and ten pounds of potassium to the ton of manure, with a dry matter basis of twenty-five per cent. and seventy-five per cent. water, the manure that will result from holding such fresh manure until it becomes more or less rotted will vary greatly in composition, depending upon the conditions to which it is subjected. If the fresh manure is exposed for a few weeks to the leaching of heavy rains, half of the nitrogen and potassium may be leached out, while smaller losses of phosphorus and dry matter occur, so that a ton of the resulting manure, in which the urine (which usually contains about half of the nitrogen and potassium) has been replaced by rain water, may contain only six pounds of nitrogen, two pounds of phosphorus and six pounds of potassium. This difference of four pounds each of nitrogen and potassium does not represent the total loss, because if the pile contained ten tons of fresh manure there will be left perhaps only eight tons of the leached manure, even with the same percentages of dry matter and water.

"If however, the pile of manure suffers less from leaching, but more from fermentation and heating for several months, the loss of dry matter or total weight will be great and the loss of nitrogen considerable, while the loss of phosphorus and potassium will be less. Thus, after six months of such conditions, the ten tons of manure, with one hundred pounds of nitrogen, twenty pounds of phosphorus and one hundred pounds of potassium, may be reduced to five tons of manure containing sixty pounds of nitrogen, eighteen pounds of phosphorus and eighty pounds of potassium. This rotted manure, with the same per cent. of dry matter as the fresh, would contain in one ton twelve pounds of nitrogen, three and six-tenths pounds of phosphorus and sixteen pounds of potassium. Rotted manure produced in this way is usually richer per ton than fresh manure, but the total amount of manure has been so reduced that the actual loss is very great."

PROTECTING TREE TRUNKS.

A wash recommended to keep rabbits and vermin from the trunks is given in the St. Joseph Fruit Grower, as follows:—Dissolve as much common washing soda as possible in six gallons of water; then dissolve one gallon of ordinary soft soap in the above; slake a quantity of lime to a thick paste and add enough of this to the above mixture to make a thick whitewash, which will stay upon the trees an eighth of an inch or so in thickness. One pint of crude carbolic acid added to each two gallons of the mixture will add to its efficiency in keeping away rabbits. It is best to scrape off all loose bark possible from the trunks and main limbs of the trees and also remove the earth from the base and scrape the loose bark from this. Apply the wash liberally from the main to the ground, covering all portions of the bark. To keep out borer, the wash must be applied in the spring before the eggs are deposited and again in about three weeks, or oftener if any of the grown insects are noticed. Apply by means of a whitewash brush.

If the rabbits or other gnawing animals are bad, I should not like to trust apple trees of mine wholly to the protection of any kind of wash. I use wooden veneer wrappers on all of my young trees, because they keep out the borers as well.

GOOD FRUIT YEAR.

Nearly all growers of good oranges, lemons or deciduous fruits have made considerable profits this year; but is it good policy to exploit this fact even as much as the facts warrant?

Growers and friends of growers should estimate profits on a period of not less than five and better still ten years.

It must be remembered that our growers need the protection of a tariff. Many congressman and senators get an idea, mostly from the most favorable reports in the most favorable years, that our fruit growers are piling up wealth with little outlay of money or labor, and therefore a cent a pound tariff on oranges and the duty on other fruits are no longer needed. Eastern consumers are being educated up to believe they should have cheaper fruit and call upon their senators and representatives to try and reduce the tariff.

It is well enough to keep it constantly before the public that there are prizes in fruit growing, but at the same time impress the fact that those who win the prizes do so at a large outlay of money, time, intelligent care of trees, careful picking, boxing and shipping, and then do not succeed every year.

Let's stand up for fruit growing, but don't make the impression on Eastern senators and congressman that it brings wealth every year or that it can safely stand without the protection Congress has so far given it.

There is no crop sure of paying the grower every year, either east or west of the Rocky Mountains; but we believe, one year with another, the profits of fruit growing are relatively sure and large for all who give their orchards timely and proper care.—Pomona Times.

The biggest rush in its fruit packing history is the claim of the Selma fruit dryers.

Imperial Valley Farms

**Wonderful Opportunities
for "Real Farmers."**

Cantaloupes, Grapes, Onions, Asparagus and all garden produce get the highest market and thus the high prices.

Alfalfa, Hogs, Dairy Cows, Sheep and Cattle cannot be raised anywhere for greater profit.

The great need of the Valley is "real farmers." At present you can buy lands at the same prices some improved lands are now selling for. The Valley is fast becoming the Great Feeding Ground of the Southwest.

Cantaloupe and garden land to lease for cash or on shares.

Bees and Their Care

POINTERS ON HONEY.

MANY stories, ancient and modern, relate to the manner of production of honey. All know be accepted as genuine honey must be the gathered nectar of flowers, obtained by bees through sucking or lapping with the tongue, which varies greatly in the various kinds of bees.

The average length of the honeybee's tongue is about two-tenths of an inch. This explains why the average honeybee cannot obtain the nectar of clover and other deep flowers, which are too narrow for the bee to enter with its body.

The honey gathered by the bees from flowers is quite different from the honey we recognize on the table. It is transparent and watery. It is taken from the flowers into the bee's stomach and deposited in the cell, where it is subjected to evaporation, or what is commonly called ripening. The cells are not capped by the bees until the honey has reached a certain thickness, which gives it the flavor best suited to the bee's taste.

This is not always the flavor most liked by humans, and the honey is allowed to still further ripen before it is used. During the process of ripening the bees keep a continuous current of air through the hive by fanning with their wings.

During warm summer evenings the hum from this continued fanning may be distinctly heard. Some believe it to be the way of disposing of the surplus heat generated by the clusters of bees. Doubtless, it serves both purposes.

Like nearly all good products of commerce, honey is often adulterated, but only in the extracted form, or "strained honey," as it is often called. The only way to be absolutely sure of getting genuine produce is to purchase the comb honey, for comb honey cannot be manufactured any more than can a hen's egg from which may be hatched a chicken.

There are some inferior grades of comb honey, due to the ignorance or carelessness of the apiarist, which critics will claim to be adulterated. If the grade of honey had been permitted to ripen more thoroughly or had received better care after removing from the hive, the quality would have been much improved.

There are ways of determining whether honey is pure or adulterated, and here is the simplest test we know. Cold water will dissolve honey readily, and when mixed, two parts of water to one of honey, the resulting liquid should be almost clear and not stringy. Fresh honey is fluid, but if kept for any length of time is apt to form crystals or finally crystallize into a hard granular mass. The presence of starch may easily be detected because it settles to the bottom on dilution with two parts of water.—*Colman's Rural*.

TREE PLANTING FOR HONEY.

It may be well for the beekeeper to try in part, at least, for the seed to induce his neighbor to grow alsike clover and alfalfa. It surely will be a use for every beekeeper to become crank on the matter of tree planting along the public highway. There are three reasons, each of which would be enough to warrant every effort to make this matter of tree planting general. The value of trees to the country in affecting climate cannot be overestimated. Europe has learned from bitter experience the necessity

of trees to regulate temperature and rainfall, and is so far more alive to the necessity of tree planting than are we. Wisdom shouts at us to learn of them and save the fertility of our country.

Again, nothing adds so much to the beauty of a landscape as do beautiful trees. Britain, France, Germany and, indeed, almost all the countries of Europe, are more like great parks than like the treeless, desert-like plains so often seen in our own America. Beauty is always attractive; and would we increase the value of our farms and lots we will make all haste to push tree planting to the utmost. Much of Germany is famed for its avenues of uniform trees along all the highways. Let us all spring to our opportunity and see to it that all our roadsides are adorned with the best of our magnificent forest trees.

A third reason for tree planting is that we may thus add immensely to the honey resources. Here, again, Germany has set us a good example. There we find the linden, the maple, the locust, and the catalpa and many other trees that are of great value to the beekeepers.—A. J. Cook in *Gleanings*.

WHY DOTH THE BUSY BEE?

The busy bee comes staggering down the airy pike loaded with honey and if you are in her direct path and she is tired and cross after a long day's work at the flower show, possibly she hands you a little red one on the neck. Yet the bee has no malice and may be excused on the ground of mistake in passing the lemon to the innocent bystander. Few people when suffering from bee sting think what the bee has been doing. To make one pound of clover honey, bees must deprive 62,000 clover blossoms of their nectar, and to do this requires 2,750,000 visits to the blossoms. In other words, one bee, to collect enough nectar to make one pound of honey must go from hive to flower and back 2,700,000 times. Then when you think how far these bees sometimes fly in search of clover fields, oftener than not, one or two miles from the hive, you will begin to get a small idea of the number of miles one of the industrious little creatures must travel. No wonder she sometimes gets cross, tired or irritated and gives you the push. The bee is a nice domestic animal and we all like her pure food product, but we do not care to dispute her membership in the Daughters of American Industry.—*Minneapolis Journal*.

SMOKER-LIGHTERS.

The uses of pieces of rag or other material soaked in a solution of saltpeter to use in starting the fire in the smoker is one of those kinks that add largely to the comfort and convenience of the apiarist. In preparing these be careful that you get the right kind of saltpeter. What you want is the nitrate of potash. I have known cases where the druggist substituted for this nitrate of soda, or "Chilian saltpeter," as it is sometimes called. For many of the purposes for which saltpeter is used this is all right; but it is not good for smoker-lighters. It does very well when it is dry, but it absorbs moisture from the air so readily that in damp weather it becomes quite wet, in which condition it is very unsatisfactory for starting fires.

The Pomona cannery put up 1,400,000 cans of peaches.

I.H.C. IRRIGATING ENGINES

If the Water is Lower Than Your Land an I.H.C. Gasoline Engine Will Solve the Problem.

THAT is often the problem with irrigators—the water is lower than the head of the ditch. The old way of doing was to construct the ditch up stream (often several miles) and head it high enough so that the water would flow down upon the land. If the only available water was a lake or pond below the land, irrigation was usually abandoned, because it was thought that the water could not be pumped up in sufficient quantities, or the pumping operation would be too expensive.

Irrigators know better these days. They are now placing I. H. C. gasoline engines on the banks of these low lying lakes and converting the waters to a beneficial use on their thirsty lands. They no longer find it necessary to build miles of extra ditch to get fall enough to reach the lands. An I. H. C. engine will take the water from the stream where it flows through or near the farm, and raise it any reasonable height.

Irrigation problems are solved with the I. H. C. engines, because they have three main characteristics that adapt them to the work:

WESTERN GENERAL AGENCIES: Denver, Colo., Portland, Ore., Salt Lake City, Utah, Helena, Mont., Spokane, Wash., San Francisco, Cal.

INTERNATIONAL HARVESTER COMPANY OF AMERICA
(Incorporated)
Chicago, U. S. A.

First—They pump water in unlimited quantities.

Second—They raise water at a low cost.

Third—They make a near approach to self operation. When set going they run for long intervals, regularly and dependably, with the least possible attention. The result is that I. H. C. gasoline engines are completely changing irrigating methods. Fertile but dry uplands are being brought under cultivation where a few years ago that was thought to be impossible.

Have you a dry farm on your hands? Or do you know of a fine piece of land you would homestead if you could get some "unappropriated" water for it? There is no reason why you should abandon your project. There's always near at hand a low lying lake or a slough or an underflow or a well or a stream down at the foot of the bluff. Find anyone of these, and an I. H. C. engine will put the water where you want it.

The engines are made in various styles, Vertical, Horizontal—Portable and Stationary. They range from 2 to 20-Horse Power.

Look into the matter and see which one of these irrigating powers will do for you. The local International agent will be glad to talk over your particular case, furnishing catalog and giving engine particulars. Or if you prefer, write nearest branch house for catalog.

Local prices for wool at Healdsburg have taken a drop of several cents during the past few weeks, and it is predicted that not over thirteen cents will be paid.

Live Stock and Dairy

CHEESE MAKING.

THE use of cheese should be encouraged as meat is steadily advancing in price and cheese makes a good substitute for it. There is not a crumb of waste in using cheese. The broken bits are like pieces of stale bread, something that is valuable to make little appetizing additions to the family table. It is the use of these little touches that distinguish the home cooking from the hotel table. The loving little pats that are added to the food, because father, or mother or Johnny or Susie likes it. Added to macaroni or vermicelli seems to be about all the ways the average cook knows about using cheese. Try using a tablespoonful of crumbs of cheese in the ordinary flour to thicken milk dressing and putting this over boiled cabbage in the pot ten minutes before serving. It makes the cabbage come closer to its cousin the more expensive cauliflower in taste. Use the same sauce with stewed celery. In this little recipe there is a world of improvement over the ordinary white sauce.

Suggestions.

Again, add a little cheese to the celery and apple salad dressed with mayonnaise. Put the little bits of cheese on plain soda crackers with a dash of cayenne pepper and toast brown in the oven to serve with the after dinner coffee. Cheese omelet, cheese with scrambled eggs; scalloped white potatoes with the cheese white sauce are desirable acquisitions to the table. Cheese adds a tempting dainty blend to other articles used. A suspicion of fine flavor rather than actual knowledge of the contents of the dish should be the result of this blending.

Home Cheese Making.

Now that the cool weather is here there is no reason why the farmer's wife cannot from time to time make a small cheese and have it always at hand to use. It would be too bad if a careful woman cannot make as good cheese as the usual offering of California cheese that the local markets in country town. Eastern cheese, or Swiss at a high price is unusually not used by the farmer at all. If the first homemade cheese does not come out perfect in flavor for eating plain then it can be used in cooking to advantage. The home cheese maker is more apt to fail in care in the curing than in the making.

Utensils.

These are cheap and few, compared to those used in making butter. A large, new granite dish pan can be used for a vat. Either a new wire toaster or a Christy bread knife for a cutting knife. If neither are available then use an ordinary silver table knife. Steel knives are undesirable to use, even though they be well scoured; there hangs about them a fishy, steely flavor that is not to be removed. Have a couple of tin hoops made by the tinsmith, or if you care to expend more money, the Guoda cheese hoops may be purchased in small sizes. Have the hoops ten inches across and six inches deep. Have two tin followers made that will just pass inside the hoops; have in these followers eight or ten small

holes to allow the whey to escape from the cheese. A good dairy thermometer that can be put into milk completes the outfit. With some good cheese rennet tablets Hansen or any other make, only not get junket tablets as they are strong enough to make cheese quickly. Some squares of cheese cloth some long strips six inches wide bandages and some ten-inch circles for tops and ends to the chesers.

Milk.

If there is enough milk, say twenty-five gallons at a milking, use the morning's milk as soon as strain and aired. The airing is done by pouring from one pail held high to the other, in a place where the air is cool and sweet. If there is not enough milk from one milking then use the night's and morning's milk. Strain the milk at night through six thicknesses of cheese cloth into the granite pan. Put the pan in a cold place covered with a piece of cheese cloth. Dust is the great enemy in California. It is everywhere; to avoid it in the milk will require care. I put the pail in a room apart and turn the key on the door so that no one walks over the floor to stir up the dust. Walking around a clean room raises dust that may be imperceptible, yet damaging to milk used for cheese.

Next Morning.

The next morning when the morning's milk comes in, strain it in the same manner and add it at once to the milk in the pan. Before adding the fresh milk, stir down the cream and taste the milk, to be sure it is absolutely sweet. If it should have the least suspicion of acidity do not use it for making this form of cheese but put it into cottage cheese, or smearcase. Later, I will tell you how that is made, so if you fail to hold the milk sweet the first time then will not be any waste, only a different product from that intended. The night's milk is sweet, then add the morning's milk and bring the pail into the kitchen. Add the coloring matter, a teaspoonful to every twenty gallons of milk, will make it light yellow, while a teaspoonful every fifteen gallons of milk makes the cheese a deep orange. Usually the common Eastern cheese we buy is about half way between these two amounts in color.

Cooking.

Put an asbestos mat on the stove and on it the pan of milk. Stir gently from time to time until the thermometer shows a temperature of ninety degrees; not a bit above this nor below eighty-six. Ninety is to be preferred. Stand the pan on the kitchen table and add the rennet. The rennet tablets are dissolved in a cup of cold water. The small rennet tablets are used, one for every five gallons of milk. The large-sized tablets are one to every twenty-five gallons of milk. Take the thermometer and test the milk. If it is between eighty-six and ninety put in the rennet. If it is not, make it right before adding the rennet. For this is a case where you have no right to do as you please, except to please to do right. Stir thoroughly, but gently for a minute. Cover the pan with

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

See us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

piece of cheese cloth for twenty minutes.

rd.

When I desire to be a certain length of time doing anything, I set the alarm on the clock and then I can make the clock with me and do some other little work. The clock calls me to the milk without waste of time in constantly watching its face. It accomplishes so much more when they guard the minutes. At the end of twenty minutes, try the curd putting your finger gently on it and pushing sideways, if it breaks away from the mass of clabbered milk with a clean, clear cut across, it is ready for the next step. If any floating particles show in the whey when the curd breaks, leave it standing until the break is clean. I find the rennet varies considerably, sometimes forming a smoothly, breaking in fifteen minutes and again other tablets taking thirty minutes. The directions that come printed with the tablets should be carefully read and followed. Each manufacturer has only a desire to have his goods give full satisfaction, and will give the directions accordingly.—M. J. Sherman.

SIMPLE STOCK REMEDIES.

For scours in calves, try a raw egg stirred up in a little milk and a tablespoonful of flour added. One farmer recommends saleratus in the milk, a teaspoonful at each feed till cured.

For lice on calves, use grease and sulphur, or spray with kerosene; do not put on too much or it will take the hair off.

If your horse breathes hard and has a cough, look out for heaves. To prevent them, do as you would if he had them. Give but little hay, and give water carefully; allow a little time after feeding and watering before putting to work. Give five-grain doses of arsenic once a day for two weeks. Improve the condition of the horse as much as possible, and relief will follow.

Often when horses are poor in flesh and not doing well, the trouble is worms. If such is the case, give a tonic—powdered sulfate of iron and gentian root in equal parts. Give six drachms twice a week till his condition improves.

Mange in horses is caused by an insect which burrows into the skin; to cure it this insect must be scoured out with sand, the affected parts washed with soap and warm water, using a brush and drying carefully; after this apply an ointment of sulphur and lard, or sulphur and water.

For a sore or wound on a horse or man I know nothing better than a solution of carbolic acid. In warm weather it acts as a repeller of flies, so.

Foul in the foot in cattle is caused by standing in mud, and may become serious; to cure, cleanse the space between the toes by drawing a small rope through, then apply sulphate of zinc, one drachm in half a pint of water.

For caked udder in cows, try this: remove one of your horses from his stall, throw a quantity of horse manure in the stall, and tie the cow in there over night. An old farmer told me of this; as I have never tried it, I cannot say as to its value; but it surely can do no harm, and it cannot always be said of dosing with drugs, either in man or beast.—John Upton, in Journal of Agriculture.

FORMULA FOR VERMIN ON STOCK.

Texas crude oil has the approval of the United States government for dipping cattle to cure mange and kill ticks and lice. It will do the work, but badly injures the hair and the skin in this climate. We now use the arsenical solution given by N. S. Mayo, V. S., in the Breeders' Gazette of Chicago, issue of March 14, 1906. It is cheap, entirely effective and does not hurt the cattle in either cold or hot weather:

For Killing Cattle Ticks.

White arsenic.....	1½ lb
Sodium carbonate (crystals).....	4½ "
Laundry soap.....	4½ "
Pine tar.....	1 quart
Water.....	100 gallons

Dissolve arsenic by boiling in water, using five gallons or more, boil half hour. When dissolved add it to 20 gallons of water. Shave the soap, mix it with the soda and dissolve in five gallons of water. When dissolved pour in the tar, pouring slowly in a fine stream, stirring as you go to get in solution. Then mix with the arsenic solution and add water to make 100 gallons. To be used as a dip, a spray or wash. The solution loses but little by age.

We apply it with a force pump, the same as used in spraying orange trees. Three men can spray 100 cattle in 200 minutes after they are penned. A small pen or chute, just large enough for one cow, connected with the big pen, is needed.—Florida Agriculturist.

PROFITS IN THE SMALL DAIRY.

A subscriber from Santa Cruz, tells us that he is going to close out his dairy of 20 Jerseys, because he cannot make any money, feed and help being so high. Several times of late we have had such information from small dairymen. Of course, the question of feed is ever present with the dairymen, some years more strenuous than others, but the milking proposition bids fair to be settled soon by the small milking machine which is being put on the market. This machine will milk a cow, it is asserted, in from three to five minutes, so that 20 cows may be milked in an hour and a half at least.

That dairying on a moderate scale pays, is an established fact. Here is an instance to prove what a farmer did with a herd of 45 cows on a Michigan farm, as reported in the Agricultural Journal:

"HENRY HART OF HARTRIDGE."

We are in receipt of a short love story, entitled, "Henry Hart of Hart-ridge," published by Fairbanks, Morse & Co. of Chicago, Ill.

The story is beautifully illustrated, the frontispiece showing the heroine, Jessie Curtis.

Numerous illustrations of the farm scenes showing the possibilities and advantages of modern machinery appliances are interspersed throughout the story.

The tale is interesting from start to finish and to those who contemplate improving their country places, the book will be found rich in practical suggestions. A copy will be sent free to those interested.

"The sheep men of Arizona have never experienced the prosperity which has been given to them this year" says Southwestern Stockmen.

The annual colt show of Polk county was held at Dallas, September 28th.

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

KEEP GOOD STOCK.

In writing about the dairy condi-
tion about Corcoran and the profit in
his own dairy, Mr. Geo. A. Smith of
the Corcoran creamery, says:

I have a herd of 275 head of pure
bred and grade Jerseys with a \$1000
Golden Lad and St. Lambert bull at
the head of the herd. My herd has
averaged as high as \$8.75 per head in
a single month, to say nothing of
the calves, pigs and poultry which
would raise that amount consider-
able.

Another herd in which 120 grade
cows were milking paid \$956.10 in a
single month, calves, pigs and poul-
try not counted. Seven, seven and
one-half and eight dollars average
per head per month is not uncommon
here.

I most certainly believe in good
stock of every kind and I also be-
lieve that creamerymen should do
more to encourage the improvement
of dairy cattle, as that is the only
way to increase the average returns
per cow. We cannot reasonably ex-
pect the price of butter to rule very
much higher than during the past 12
months, so in order to get greater re-
turns from our dairies we must in-
crease their ability to produce butter-
fat and we do this by introducing
better blood. I also believe the
dairyman should improve his stock
along the lines he likes best. Should
he favor Holsteins, then get Hol-
steins; should Jerseys be his choice,
then get Jerseys, or the same with
Durahm or Ayrshires or Guernseys,
and having once made his choice
stick to it and continue to improve
along that line of breeding and do
not every few years change the breed,
as crossing the breeds never improves
the stock and that is the one great
trouble with the average dairyman
of today—he is the victim of too
much crossing of the breeds so that
he has no distinct breed but a mon-
grel lot of common scrubs and gen-
erally of the commonest kind, pay-
ing three, four or five dollars per
head per month, and from one-third
to one-half of the herd in the dry
pasture producing nothing.

The Jerseys are my favorite breed.
They are not large milkers, but they
are great for sticking to it. They
will set a pace and keep it up, and at
the end of the year I find an aver-
age between 300 and 400 pounds
of butterfat per cow. Furthermore,
my cows are giving milk. Not 5 per
cent of them are in the dry pasture.
They are persistent milkers and it
is with great difficulty that we are
able to dry them up when we wish to.

While with some breeds, they make
a great spurt on the start and make
enormous 7-day and 30-day records,
but at the end of the year they are
not in it with the little Jersey that
sets a good pace and sticks to it.
Just so with the good roadster that
starts in the morning on a long trip
and sets a good steady gait—at night
he will be farther on the road than
the horse that makes a great spurt
on the start and soon tires himself
out.

Veterinary physicians and surgeons
advise, washing the galled shoulders of
the horse with a mixture of alum and
water. This is soothing and cooling
to the affected part.

Destroy lice, expel worms and pre-
vent constipation. With proper feed-
ing this will put your hogs into con-
dition to resist disease.

FEEDING THE CALF.

The season is now on when calves
will need attention to keep healthy.
In no way can this be done so well
as by care in feeding. During the
first week of the calf's life it should
be fed principally on whole milk.
Then begin gradually to change to
skimmed milk by adding a little each
day and decreasing the amount of
whole milk, so that at the end of
three weeks the calf will be entirely
on a feed of skimmed milk.

Do not at any time give the calf as
much skimmed milk as it can drink.
It is strong physically, but its stom-
ach is weak, and if it is given more
than it should have its digestive
system will be deranged and illness
will follow.

After it is two weeks old, give it a
little ground corn or gluten meal in
the milk. The skimmed milk is rich
in protein and the addition of these
fat-containing feeds is necessary to
balance the ration. When whole
milk is given, this is nearly balanced
because the cream, containing the
fat, has not been removed. Some
add oilmeal to the skimmed milk,
but this does not balance the ration.
Oil meal is also rich in protein, but
contains very little fat-forming
food elements.

When it is desired to wean the calf
from skimmed milk, do so gradually.
Decrease the amount fed a little each
day till the calf is weaned.

Best results are obtained by not
feeding more than a gallon and a
half of skimmed milk to the calf at
one time. If more than this is given,
the animal overloads its little stom-
ach and serious trouble may follow.

CONTAGIOUS ABORTION.

The disease is likely to be mistak-
en for accidental or sporadic abortion.
The latter differs in that it may occur
at any point during pregnancy; there
are more marked premonitory symp-
toms, the act is not so easily accom-
plished, the placental membranes are
more likely to be retained, it may be
due to injuries, to food, to cold, to ex-
posure, to storms, to drinking very
cold water, to drugs, to constipation,
etc. There will not be so many ani-
mals affected, and if several should
abort it will be within a short period.

Treatment—This disease will per-
sist for two or three years in a herd
if not properly treated. The treat-
ment is purely antiseptic. It has been
found that separating the sick from
the well, destroying fetuses and
membranes, and thoroughly washing
out the uterus and vagina twice a
week for seven or eight weeks, and
not breeding until the third month
after abortion that the trouble is com-
pletely checked the following season.
The antiseptic used was 2 per cent
cresol. The cattle should be made to
pass through a chute, and while in the
chute, a douche is administered by
means of a large-sized force pump and
rubber hose. The rump, tail and
soiled parts are treated oftener. The
male must be washed out thoroughly
at frequent intervals. The same line
of treatment has been followed with
excellent success in herds of sheep.

The Guernsey is commanding at-
tention and approval as a breed that
is especially fitted for winter butter
and cream, and when their positive
character is generally recognized
they will be largely used to produce
a winter milk that has all the color
and delicious flavor that is usually
associated with the golden days when
clover is in bloom and the pastures
are knee deep in grasses.

Clean Skimming Means Good Living

The hog trough is no place to put
butter.

Wide awake farmers want the
cream separator that skims the clean-
est. It means more profit—better
living. That separator is the Sharples
Dairy Tubular—no separator that's
different.

Sharples Dairy Tubulars have
twice the skimming force of any other

separators—skim twice as clean.

Prof. J. L. Thomas, instructor in
dairying at the agricultural college of
one of the greatest states in the Union,
says: "I have just completed a test of
your separator. The skimming is the
closest I have ever seen—just a trace
of fat. I believe the loss to be no great-
er than one thousandth of one per
cent."

That is one reason why you should
insist upon having the Tubular. Tub-
ulars are different, in every way, from
other separators, and every difference
is to your advantage. Write for cat-
alog \$-.30 and valuable free book,
"Business Dairying."

With the Citrus Growers

PICKING AND PRUNING THE LEMON.

NEVER pick lemons in sacks; use a basket and transfer to the picking box three in each hand carefully. It will always pay to take this extra care in picking lemons. It seems we cannot impress on the minds of the lemon growers the great necessity of handling their lemons carefully. Any slight rubbing together, such as picking in sacks, causes quick decay. Some growers who are obliged to wash their lemons on account of smut, say that it does not harm their keeping qualities; but we want to say just now to those who wash their lemons, that as long as you hold to that idea just so long you fail to be successful in lemon growing.

There are other things just as essential, and that is picking lemons at the right time. You do not pick frequent enough. We notice orchards every day where the lemons have been hanging on the tree for weeks after they were large enough to pick, and then when they are picked we get lemons from a small, undeveloped size one and one-half inches in diameter, to a great overgrown size, three and one-half inches in diameter. Now this is all wrong and many growers who did this admit that it is wrong, but let us state the general excuse for this: that it does not pay and they cannot afford the expense of going over orchards as it should be done. Now it will ever pay at all, it will pay to attend to this as it should be done. When picking lemons use a two and one-fourth-inch ring and do not pick a lemon that will not fill the ring—unless the lemon is yellow or very imperfect. Then it should come off any time. Keep up this picking every two weeks for one season and you will be surprised at the increase in both quality and quantity.

Dry, hot days are bad for picking lemons, as they soon wilt if not attended to. Keep them out of the sun, and the boxes, when filled, should be covered up closely to keep the moisture, and they will keep firm. There is a great deal to be done in the way of pruning, in both the lemon and orange. Head back and thin out. Many people object to heavy pruning or the only reason that it requires so much work to thin out and control the new growth. There are orchards that have been pruned for three or four years but the thinning out process has never been performed and the trees are almost worthless as they are now. Let us give more attention to the growing of a better quality of lemons.

GIVE THE TREES FERTILITY.

Commissioner Pease of San Bernardino county, apparently believes that our orange growers must wake up and give proper fertility to the soil. In a letter to the Cultivator, he says:

"There is quite a difference of opinion in a certain locality in regard to the cause of dead wood in citrus trees. Some call it Florida Die back and are spraying with Bordeaux mixture. Others who are considered good authority, think this is working in the wrong end of the tree and are using fertilizers as a remedy for the difficulty.

"For myself, I favor the latter theory for I have found that the poorer and more porous the soil the greater the amount of dead wood."

ORANGES IN PORTO RICO.

A most interesting letter has been received by J. W. Mills regarding citrus conditions in Porto Rico, from Fred Palmer son of Frank L. Palmer, superintendent of the large Richards Orchards at North Pomona.

Regarding Mr. Fred Palmer, Mr. Mills writes:

"Fred worked with me on my fertilizer experiments for two years; went to New York city where he worked in an office for a year and was sent to Porto Rico by a company to take charge of their 250-acre orchard."

The letter was written from San Juan on Sept. 14, and from it we quote:

"It is hard to know what to say about Porto Rico when writing to you. It is a country which has unlimited possibilities. We are raising (or trying to raise) citrus fruits. Our neighbor just across the Bagamon Rivers is raising sugar cane and pineapples. Some little distance farther inland toward the mountains, we find an American opening new land for coffee and tobacco. Others are interested in cocoa berries, peppers and such small scrub products as that. There are numerous coconut plantations that seem to be thriving.

"The price of property is rising steadily. American industries are noticeable at every hand and improvements are being made along many lines.

"We do not know which are the most profitable of all these different products. Our shipping and transportation facilities have not been perfected yet to the extent that we can know. Transportation will be cheap but will it be fast enough to avoid decay?

"The oldest citrus trees in our plantation are six years old and are very large. Grapefruit seems to be a sure crop. They raise grapefruit that is as fine as any that goes into the New York markets, but the oranges are still on the doubtful list. They have about twenty different varieties growing, including all of our standard California varieties. The most are different odd, old fashioned Florida varieties which really are of little value. They have budded all these onto native sour stock. This makes a very hardy fast-growing tree.

The trees are of a different shape than our Washington navels, they grow more open and scraggly, due I think to the continuous humidity in the air, and to the continuous trade winds. They do not seem to possess the fruit-bearing wood that our trees do. They have a tendency to make wood instead of fruit.

"Our plantation of 250 acres is located on the seashore on land that was once a heavy forest or jungle. This has been cut away and by leaving strips of the forest, they have a strong wind break left standing for the protection of the intervening strips of orchard.

"We get very quick results from our fertilizers as the soil is very full of lime. There is no subsoil, the roots are all on the surface. The whole plantation is rolling, having been entirely formed by the ocean. The soil is all on the surface, the sub-structure being nothing but sand. It is very interesting to me. I think there is nothing like it in California."—Fred B. Palmer.

The Superlative Raspberry

Too much cannot be said in favor of the Superlative. It is a red, sweet berry three times as large as any other Raspberry, to my knowledge. It is a continuous cropper from May to November. I counted on one cane 472 berries of different sizes. Just think of a sweet raspberry as large as a Red Logan. Do you know what that means? It means for years to come heavy demand for fruit and plants. Every nurseryman will want a heavy supply. I received 5,000 plants from the introducer in Europe last Spring, and another 5,000 will arrive in November. I offer 2-year-old Plants now at 50c each, \$5.00 per 12, express paid. Going fast.

The Vegetable Gardener

STORING SWEET POTATOES.

THE following valuable hints on storing of sweet potatoes are taken from a bulletin recently issued by the Alabama Experiment Station:

(1) Never employ diseased roots to secure sets. (2) Destroy, by burning all diseased roots and sets, and do not feed the diseased roots to animals if the resulting manure is to be placed upon the field where the potatoes are to be drawn. (3) In general, commercial fertilizers are preferable in sweet potato culture on the above account, and particularly in the beds employed for the growing of the sets. (4) As you select your sets it may be well to lift the root and discard sets coming from roots showing the rot. (5) Do not place diseased potatoes in storage, as the loss may be very great. (6) The young sets, if diseased, may be sprayed with Bordeaux mixture. (7) If the disease has proven serious during the past year it would be well to mix a tablespoonful of sulphur with the soil about each set as it is planted. (8) Practice rotation of fields if one field becomes too badly infected with the fungus. (9) Collect and burn all diseased roots and stems.

In order to lessen or prevent rot the potatoes should be perfectly dry when put in storage and kept dry throughout the period of storage.

During the sweating period just after the roots are stored care should be taken to see that proper ventilation is provided and that the temperature be kept at about 70 degrees F. The temperature, in case enough roots are stored to make the erection of a regular storage house profitable, may be best secured by means of a small stove. Where the roots are stored in the usual dirt-covered piles it is important not to let water get on them whenever they are opened to remove any potatoes. The fungus requires a certain amount of moisture for its most rapid development, and this is too often furnished by carelessness in opening these piles.

The rots are caused by well-known plant diseases, one of the most injurious of which is the soft rot. This disease usually gains entrance the first week, giving plenty of ventilation to carry off the moisture. After this the temperature of the storage room may be maintained at from 50 to 65 degrees F.

If this process is not convenient a good method is to give all the ventilation possible so the potatoes can dry very rapidly for about two weeks. It is necessary to guard the ventilation and permit only dry air to enter, as moist air will deposit its moisture on the cool potatoes and this will produce the best possible condition for the potatoes to begin rotting.

The storage room must be dry, and very few cellars meet this requirement. The ventilation should be just sufficient to keep the air pure and the potatoes dry. The condition of temperature should be provided for in the construction and location of the building. Small quantities of potatoes can be kept by storing them in dry sand or road dust and keeping them at the proper temperature. The old time practice of piling the potatoes on the ground and covering them with straw and litter and then with soil is too often a failure to be recommended.

SALSIFY—"MOCK OYSTER."

This is a vegetable that deserves wide cultivation. It will thrive even poor soil, and manure should never be put close to the plant as it causes them to throw out so many fibrous roots instead of attending strictly business and making one strong root that will grow larger than a snip and if rightly cooked is gift with the faculty of making you think your meal is from the scallops of the ocean. After the thistle-like blossom have dropped the seed, if the ground is moist, it will come up thickly and must be thinned to six inches apart or if transplanted it must be done when quite young as with all deep rooted plants. It grows prolifically in California and more than supplies the place of the parsnip that gets quite surly because the thermometer does not drop down below zero, so it can hibernate all winter.—Kerman News

WATER PUMPED THROUGH PLANTS.

Few realize how continually the plants that grow on the earth are pumping water from the soil into the air. Every normal plant is engaged in this work, and the surface of the earth is covered with them except in the regions of eternal frost and the great deserts. Experiments made in Utah showed that through June, July and August of one year each foot of soil lost by evaporation of moisture through plants over nine pounds of water. When this is multiplied the number of feet in an acre gives over 190 tons of water for single acre. When this is extended to the plant-covered surface of the world it indicates the fact that a good sized ocean of water is by the plants pumped up into the air each year and that for each day a good sized sea is so returned back to the element from which it came—the air.—Coleman's.

TREE RASPBERRY.

A "tree raspberry" is said to be the latest fake in the East. The Horticultural Department of the University of Wisconsin Experiment Station is warning farmers against buying the "Tree raspberry bushes." Claims and endorsement are commonly made by agents without the knowledge of any one connected with the station. It has been the policy of the Horticultural Department not to recommend novelties, for it has always advised the farmers of the State to purchase only known varieties and let the Experiment Station test the merits of the new varieties. The Horticultural Department has not tried the "tree raspberry" and has not had this plant brought to its attention.

Chickens and gardens are supposed to be absolutely incompatible, because the old hen is apt to scratch up newly planted seed and also to eat into cabbage heads, tomatoes and such things. But if such damage can be averted in any way, it is a good thing for the garden for the chickens to run in it. They catch innumerable bugs and moths that do harm, and they always thrive in the garden.

Watch the weeds in the strawberry patch and don't let the fall rains give them a fresh start.

Walnut trees at Dundee, Oregon, are yielding as high as fifty pounds of nuts per tree at ten years old.

The Ornamental Garden

THE HAPPY GARDENER.

When you die, earth lover,
Flowers shall be your cover.
Braver than the purple pall
Spun to veil dead kings withal,
You are weaving day by day,
Beauty for the sun to slay,
The fleeting pageant of delight
That dwells within a garden bright.
You this Persian carpet spread,
And named it a sweet William bed.
You painted this great lambent
screen
Of larkspur, lillied white between.
You hang vine garlands, low and
high,
Ripe for Bacchus, reeling by.
You are the over-lord of grapes
And plums, and all alluring shapes
To win the eye and tempt the tongue,
Globed liquid honey, leaves among,
Living, you, an earth-born guest,
Are of men the mightiest;
And when you die, earth lover,
Flowers shall be your cover.

—Harper's Magazine.

"BACK ENDS."

IF YOU have ever given the sub-
ject a thought, you have probably
noticed that the home-folks, the
family, live largely in the rear rooms
of the house, whether the dwelling be
in city or country, the house large or
small, says a writer in Journal of Agri-
culture. This is not always or often
because of a desire to "keep up ap-
pearances," as some irresponsible
writers would have us believe. One
very big reason for this is that the
house mother usually spends the most
of her time in the region of the
kitchen, and where the mother is,
there is always the atmosphere of
home, which no other place does or
can possess. It seems natural for the
family to gather in such places when-
ever a leisure moment occurs.

In many homes, if the sewing is not
done by piece-meal, or "snatch-grab"
methods, it does not get done at all;
so the sewing machine is located at
one of the kitchen windows where the
home seamstress can sandwich the
sewing and the cooking together and
where the sewing machine is, there
will darning and patching basket be
found also. Where the kitchen is
small, or "cluttered" with much fur-
nishing, the dining-room is often an-
nexed for the home work; but every-
thing hinges on the kitchen, or the
rear rooms at least; the house mother
is always sought and generally found
there; the babies are reared; and
there the toddlers can play without
let or hindrance, while the older
children find it an ideal workshop for
their own affairs. In these rooms, no
matter how topsy-turvy things may
get, a touch here and a lift there, as
the mother goes about her work, can
keep down the worst of the disorder,
and she can thus "keep an eye" on
the restless youngsters, smiling ap-
proval or settling disputes without
neglecting her own business. So, the
real home of the house is in the rear
rooms.

But did you ever look out of those
back windows and notice the condi-
tion in which the backyards are kept?
Just cast your mind's eye over the
backyards you have seen—your own
among them—and tell me what you
think of the view as a "daily food"
for the tired eyes of the housewife
as she steps to the window or door
for a moment of rest or inspiration.
Oh, no; it is not likely she has ever
complained—women seldom complain
of such things; they are good at mak-
ing excuses for your negligence; but
did you ever hear her compliment
them?

If this has not entered your mind
before—or if it has—now is a good
time to take an inventory of the fur-
nishings of this outlook from the
back windows, and if the view is not
satisfactory, decide what can be done
now or later on. You will find that
right now is a good time to begin,
and if you do begin the good work, do
keep it up until you have made
amends. It is a good idea to go over
the house grounds with a pencil and
a blank book, and note down the
things as you see them. Even if you
have a nicely arranged yard with
grass and shrubbery and a few shade
trees growing, now is a good time to
see if any improvement in the plan
could be made. Give the good wife
the privilege of suggesting and of ex-
pressing her preferences. Do not
take your neighbor's or your chance
visitor's word for it that all is as it
should be. Let your wife speak and
tell you what she wants. She has to
live with this view before her eyes,
in season and out of season and the
outlook should be according to her
taste. I know a woman who simply
hates her home because it is shroud-
ed in vines and shade trees to such an
extent that she is a veritable shut-in,
and can see absolutely nothing out-
side the walls of leaves close to the
windows and doors. Yet others com-
ing into the coolness from the sights
of the streets or country are delight-
ed with its seclusion! Would you
blame this woman if she "nags?"
There is absolutely nothing by which
she can rest her nerves or change
her thoughts, except to grow more
discontented because so imprisoned.
Owing to defective hearing, this im-
prisonment is absolute, as there is
neither sight nor sound to change the
current of her thought, and it is im-
possible for many reasons for her to
get away from her solitary confine-
ment.

There are many things dumped
about the back yard which have no
business there. On some farms these
"things" consist of anything, from a
rusty nail to a disabled threshing ma-
chine, and great forests of worse than
useless weeds are fostered there
among the rubbish. From the fact
that the grounds about such houses
are usually the receptacle of all the
house-slops and of many other kinds
of fertilizers, the soil is usually very
rich, and it would be an ideal spot
for a lawn, or flower garden, or even
a cultivated vegetable garden, for
useful things would grow there as
well as weeds and with much more
profit.

It is generally true, too, that all
the outbuildings, however unsightly
or unsavory as to smell, are in full
view of these windows and doors,
and very, very frequently the back
yard is really considered as part of
the stock yard, where calves, colts,
pigs, poultry and the like are turned
out as a matter of course! Now, do
you wonder that the women and
children—especially the growing
girls and boys—long to get away
from the farm? Do you wonder that
the young people prefer the hardships
of the city to the "comforts" of the
home they are ashamed of?

I hope the gude mon will get his
eyes open and take a look at these
tangles. I know just how they look
to the eyes of the beauty-loving
woman; for—well, I lived on a farm
once; I might say I lived on several
of them and I know whereof I speak.

SANTA BARBARA'S METHOD.

The general public has some time since made up its mind that the automobile has come to stay. It may not be a welcome fact, but it is a true one, nevertheless. We have got to look the situation in the face and be content with what we see. This being the fact, we have also to realize that the automobile has certain rights on the highways which we are bound to take notice of and to respect. We do not like to be forced to this conviction, for the automobile is a natural nuisance. It is a dirt disturber, a road destroyer, horse frightener and a nerve breaker. It causes accidents, and in the hands of a careless driver or incompetent driver is a death dealer. But it has come to stay. Recognizing this fact, we must consider its relation to our public highways. On some classes of soil it tears the crown of the road to pieces and makes chuck holes which seriously impede travel and retard the progress of farmers' teams hauling loads to market. On other soils it does not do that injury, but generally speaking it is not good for a highway. Automobilists know this, and in some sections of the country have formed good roads clubs and are proving exceptional road makers, so much so that the farmers are becoming enthusiastic supporters of the automobile good roads clubs, and are lending assistance to their endeavors to make the highways in all respects first-class.

An example in mind is the automobile club of Santa Barbara. Through that county were stretches of very bad roads. The supervisors would not repair them, so the automobile owners did, and this is the way they worked: They gave a picnic to the farmers in the section where the roads needed repairs; they turned out as a club in full force, taking their wives with them; they mapped out the section to be covered, and while the women prepared the meal they turned in with

shovels, picks, and even hand-scrapers, filled in the chuck holes, used their big machines to level down the humps, and before night had a good stretch of country covered. The supervisors looked on, so did the farmers, and when the day was over and a couple of miles of bad road had been put in fair condition, the spectators voted that the automobilists were not such bad fellows after all, and that they were entitled to fair play, at least. Since that date continuous work has been going on, until the worst places are mended and the whole county is shouting the praises of the Santa Barbara club.

Speaking of the accomplishments of this club, one of its members says:

"We didn't do the work of a good gang of hardy laborers, but the work had the effect of showing the county officials that we meant business, and since then they have given us their hearty co-operation. It was largely through the efforts of the Santa Barbara club that the Casitas grade was fixed, eliminating the one very bad pitch. This was not in Santa Barbara county, but we wanted the improvements, and by combining with the farmers in that vicinity completed the new road.

"There is no excuse for the roads in Los Angeles county. A live leader and concentrated pulling will bring results. The motorist cannot sit still and accomplish anything by talking. It takes action, but once started the improvements will move rapidly.

"In my observations I have come to the conclusion that one of the main faults in the county road work is the lack of knowledge in road building and repairing. Men are put to work on these roads who know no more about the work than a small boy. There has been a lot of money wasted on our roads, but if the three counties—Los Angeles, Santa Barbara and Ventura—will get together and do something, there will be some good roads between Los Angeles, Ventura and Santa Barbara. Here is one of the prettiest trips in the southern end of the State, but during the fall of each year the road is in such shape that part of the pleasure is destroyed. It would be to the advantage of all of us to have a fine road between these points.

"During the winter Los Angeles, Pasadena and Santa Barbara are crowded with tourists from the East, many of whom have their motor cars. These people want to take trips about 100 miles in length, but they insist upon decent roads, and, as things now are, we cannot offer such."

Here is an experience certainly worthy of being repeated in every locality where there are enough automobiles to form a club. If the owners of autos throughout the State will organize for good roads, they can exercise an influence which will be powerful in accomplishing the result. Let the idea of the Santa Barbara club be advanced until every county in the State shall have one or two clubs whose object is to give practical assistance to supervisors and citizens, and by so doing awaken public sentiment to the value of first-class highways throughout the State.

COOLING FRUITS.

Fruit shippers generally are recommending the practice of cooling summer fruits before shipment. In a paragraph in Coleman's Rural World, the statement is made that "within a few years all important fruit-shipping stations will probably be equipped with cooling apparatus and the cars will be chilled down before taking on their loads." It has only been a few years since fruit cooling before shipment in hot weather has been in vogue, but during that time experience has shown that the process pays well, for the expense in cooling the cars is amply recompensed by reduction in percentage of decay. California shippers who have resorted to the practice of cooling the cars before loading, report much less loss from decay than formerly. From information gathered by Coleman's Rural World it appears that fruit thoroughly cooled before it is started, and with the interior of the car thoroughly cooled before it is iced, a marked lessening in the quantity of ice to complete the journey is shown. At the same time, says Field and Farm, the fruit is kept in much better condition than when placed on board when warm and then cooled after the car has been closed up, a condition that to a certain extent causes sweating of the fruit, inducing decay. If the fruit is thoroughly dried and cooled and the car is also chilled, the decay is reduced to almost a minimum and the cost of icing is practically one-half.

FARMERS' INSTITUTES.

The department of agriculture of the University of California announces the following dates for Farmers' Institutes: September twenty-sixth and twenty-seventh, Ione, Amador county; October the fifth, Seabright, Santa Clara county, special poultry institute. On October fifteenth and sixteenth Institutes will be held Corning, Tehama county; on the seventeenth and eighteenth at Orland, Glenn county; on the nineteenth at Maxwell, Colusa county; on the twentieth and twenty-second at Arbuckle, Colusa county. Professor Warren T. Clarke, Superintendent of university extension in agriculture, Dr. C. M. Haring of the veterinary department of the university, Mr. C. Westergaard, instructor in farm mechanics, Mr. G. B. Lull, state forest ranger, and Mr. A. Warren Robinson of Napa, an expert in poultry management, will attend these meetings. The department of university extension in agriculture also announces Institutes under the direction of Mr. J. B. Neff, conductor of Farmers' Institutes for Southern California, as follows: October fourteenth, San Miguel, San Luis Obispo county; October fifteenth and sixteenth, San Maria, Santa Barbara county; October eighteenth and nineteenth, Lompoc, Santa Barbara county; October twenty-first and twenty-second, Compton, Los Angeles county; November eleventh and twelfth at Farmers' Hall, 12 miles south-west of Bakersfield; November thirteenth and fourteenth at Rosedale, six miles west of Bakersfield; December second, Banning; December third and fourth, Coachella; December fifth, Brawley; December sixth and seventh, El Centro; December tenth and eleventh, San Jacinto; December 12 and 13th, Elsinore.

AS THE PRODUCER SEES IT.

Dairymen, who have been charged since the rise in milk, with being in a trust, come to the front with a general denial that such a trust exists, and state that the recent rise was occasioned by the fact that feed has advanced to such a figure that it was absolutely imperative to advance the price of milk to make anything out of the business if not to avoid running behind. They state that formerly they produced milk on hay which cost \$10 per ton, bran which cost \$14 per ton and oil cake which cost \$20 a ton. Today hay costs from \$17 to \$20 per ton, bran \$27 an oil meal \$30. Labor costs from a third to half as much again as formerly, and all necessities such as lumber for barns and sheds, taxes and insurance bring the cost of production up where advance in milk was necessary. We do not look to see butter and milk go much lower until we are able to produce more of each, and we cannot extend our dairies very much without irrigation.

As irrigation is extended and alfalfa field spread, the industry will increase, but with the ever increasing influx of tourists and settlers it is a question whether dairymen will any more than keep step with our natural growth.

Dairying in California has a great future.

COMMON SCHOOLS AND THE FARM YOUTH

Continued from First Page

and perhaps an aquarium and a terrarium. Here the children will bring their flowers and insects and samples of soil, and varieties of corn or beans in their season, and other objects that interest them and here they may perform their simple work with implements and tools. Even if the teacher cannot teach these subjects, the room itself will teach. The mere bringing of such objects to school would have a tremendous influence on the children; patrons would ask what the room is for; in time a teacher would be found who could handle the subjects pedagogically. Now we see children carrying only books to school; some day they will also carry twigs and potatoes and animals and stones and tools and contrivances and other personal objects.

My plea, therefore, is that the school accept all wholesome conditions in which it is placed, and that it begin with the sphere in which the child lives. The working out of this philosophy is nature study (I know of no better term); and this philosophy goes deeper than mere manual training, or than arts and crafts studies, or than bare "self-activity." Nature study, as I conceive it, is not another subject, not something external or added to. It is a means of education, internal, central, essential, fundamental. In time nature study and agriculture will be as much a part of the country school as oxygen is a part of the air.

Agricultural Notes of the Pacific Coast

Northern California

Oroville is to have a new olive oil mill.

A pre-cooling plant is to be erected at Roseville.

Seventy-five dollars a ton is offered for figs at Oroville.

Hop market is somewhat stronger than for some time.

"More cars" is the cry of stock dealers at Red Bluff.

The initial farmers' institute at the State farm at Davisville, is to be held October 29th to 31st.

Fifteen acres of alfalfa near Woodland netted \$1605 this year.

Corning is to have a Farmers' institute October 15th and 16th.

The raisin crop this year is the heaviest which Colusa county has known.

The private experimental farm at Willows has ceased to experiment for the want of funds.

The Colusa Sun reports that Glenn county's rice fields makes one of the prettiest sights to be seen.

The vineyards of Yolo county are yielding the largest output in their history, says the Yolo Democrat.

Trees which were defoliated in Marysville are now in full leaf and some of them handsomer than ever before.

Colusa county hopes to take the lead as a butter producing section. A new creamery is expected soon at Princeton.

Producers at Yuba city are in hopes for a line of steamers to give better transportation facility than heretofore enjoyed.

Prune growers of Chico and vicinity will realize \$200,000, and the peach growers about one-half that amount, as the result of this year's output.

The California Inland Water Ways Improvement Committee, comprised of twenty-five members from all parts of the State, is to become guardian of the State's rivers.

Five hundred and forty-eight tons of beets were run through the Alta-California Beet Sugar Company's mill at Hamilton city last week. This is the biggest run for that mill this season.

The sugar beets produced about Woodland, in Yolo county, have been of such quality this year that farmers there are hoping for the establishment of a sugar factory in the near future.

The Petaluma Poultry Keepers' Association met and discussed the matter of arrest for poultry thieves, and took the first steps to raise a reward fund of \$500 to be given in case of arrest and conviction.

The Colusa Sun says that many northern Sacramento valley fruits which have heretofore been shipped under Los Angeles labels will hereafter go forward under labels giving credit to the community where the fruit is produced.

Few people realize the magnitude of the levee work going on in Sutter county. One hundred and fifty men and three hundred head of horses are engaged in one piece of work. This levee is to be constructed for a distance of 12,700 feet.

Central California

Muscat raisins are already being delivered.

Shipments of prunes have begun from Tulare.

Beans are commanding very satisfactory prices.

Pajaro valley fair opens at Watsonville next Monday.

Tulare county citrus fair is to be held December 3rd to 7th.

A special poultry institute will be held at Seabright, Oct. 5th.

Some exceptionally fine fruit is being shipped from Watsonville.

Many wells are being sunk for irrigation purposes about Hanford.

Tulare Grange makes fine exhibits at the Tulare county fair this year.

The display is the best ever was, the verdict regarding the Hanford fair.

The cool and cloudy weather has caused slower drying of raisins than usual.

Work is progressing satisfactorily in the big beet sugar factory at Corcoran.

Tulare State Board of Trade is making an effort to secure a cannery at that point.

The seedling season in the large raisin packing houses at Fresno is now fully on.

Two hundred pounds of cheese a day is the output of the Lake cheese factory at Hanford.

The hop louse has appeared in some of the yards and vigorous action is urged to wipe out the pest.

The C. C. U. is building a new packing house at Exeter to be in readiness for the coming orange crop.

Suits against the walnut growers for infringement on the walnut dip patents are being filed almost daily.

Turlock Journal says that spraying for the curl leaf and blight will begin in that section about November 15th.

"The coolest season in the memory of the oldest inhabitants" is the claim for the San Joaquin valley weather this year.

Smyrna figs about Turlock are said to be exceptionally fine this year, and the planting will be greater than usual this season.

The farmers of Turlock have organized and incorporated a society to advance the interest of that community and keep out Japs.

The reduction of fruit rates from San Joaquin valley points to Los Angeles will give advantage to the fruit and dairy produce shippers.

Chas. Rodgers, president of the Watsonville Orchardists' Association, says that the association will make a large exhibit at the coming Pajaro valley fair.

The department at Washington will send an engineer to take charge of the survey of Salinas valley in the expectation of extending irrigation in the near future.

At the regular monthly meeting of the executive committee Anti-Debris Association held in Sacramento last week, notice was served upon the Dredge Miners' Association to the effect that if they did not cease allowing debris to escape into the rivers and streams in the vicinity of Oroville, suits would be instituted.

Southern California

Santa Ana begins to feel it has its sugar factory almost within its grasp.

A large number of threshers are at work in the bean fields of Ventura county.

Southern California orange output is almost at an end for the season of 1906 and 1907.

The walnut harvest of San Juan, Capistrano, is more advanced than formerly at this date.

The Eastern Highlands Orange Growers' Association is about to install a pre-cooling plant.

A car of Fullerton Valencias sold in New York recently at a price running well up to \$5.80 per box.

Walnut growers are more determined than ever to win in the fight against the walnut dip patent.

Plant more walnuts is urged by many who see in that fruit the bringing of much wealth to California.

A new kerosene emulsion introduced by Commissioner Cundiff of Riverside county is proving successful.

Several sections of Riverside and San Bernardino counties were visited by a small sized earthquake last week.

The Pomona cannery is now employing about 250 hands each day, and its weekly pay roll is about \$2000.

The experimental date plantings made at Mecca by the government are proving more and more satisfactory each year.

Covina Farmers Club finds interest in discussing county division and joining itself to the Pomona county division movement.

The work of the Newbert protection district by which the Santa Ana river is to be controlled began near Santa Ana last week.

It is estimated that the California Fruit Growers' Exchange will handle 55 per cent of the oranges of California this coming season.

The Highlands Fruit Growers' Association finds expenses for this year lighter than anticipated, and from expense fund have refunded to the members \$3300.

Last year's output of walnuts in California was 5355 tons. Some claim this will be lessened this year, while others say this year's output will be fully up to the last.

Beets at the Los Alamitos sugar factory are testing exceptionally high and are all of fine quality this year. The daily average test has always been above twenty per cent.

The present campaign of the Oxnard sugar factory is said to be the most successful in its history. The tonnage is running high and the percentage is higher than before.

Tim Carroll, of Anaheim, who has patents on a wagon-dumping appliance, has begun suit against the Los Alamitos sugar factory and J. Ross Clark for \$100,000 for infringement.

Several sections of Southern California are circulating petitions urging appointment of J. W. Jeffrey as horticulture commissioner in place of Elwood Cooper whose term has expired.

The Coast

Seattle dealers are buying hay in Idaho, Montana.

Best ranch eggs are selling at Portland for thirty cents.

Cottonseed is quoted in Texas at \$19 to \$19.50 per pound.

Seed barley is commanding \$24 per ton in Spokane, Washington.

Prunes are being shipped from Albany, Oregon, by the carload.

It is now estimated that Oregon's hop crop will be about 110,000 bales.

Sheep in Southern Idaho are giving way under the extensive irrigation.

More farmers are now claiming Colorado land than at any time in her history.

The Angora Goat Growers' Association will meet in San Antonio, Texas, November 15th.

Owing to the shortage of the crop, Oregon hop growers are urged to hold back for better prices.

A company has been organized for the producing of copra in the Koolan district, Hawaiian Islands.

Prunes will be larger and finer is the claim of many prune-growing sections of the northwest.

More wheat will be marketed in Pullman, Washington, is the prediction of the Spokesman Review.

Horse shoeing is to be included among the courses of instruction of the Colorado Agricultural College.

Jingling dollars in their pockets makes the fruit growers of Wenatchee take on the smile that won't rub off.

Two carloads of hogs fattened on Spanish peanuts were recently sold at six cents per pound at Cameron, Texas.

The new town of Omak, near Riverside, Washington, is making an effort for the establishment of a sugar factory.

Hawaii exports to the United States \$29,000,000 worth of products and received from the United States over \$14,000,000.

The reputation of the Hawaiian pineapples has extended to Europe and fancy prices are now being paid for that fruit.

A Texas man has bought a large ranch and gone to elephant raising. He claims the elephant will do the work of six horses.

The Kona Vineyards Company, engaged in producing wines in Kona, Hawaii, has increased its capital from \$50,000 to \$1,000,000.

The Northwestern Horticulturist is appealing for a national nursery law which will give uniform regulations for nurserymen.

At the Colorado State Fair held at Pueblo, dry farming products took two hundred and ninety premiums over irrigated land products.

Prof. Withycombe, of the Oregon State Agricultural College, will hold a number of farmers' institutes in the latter part of November.

A fruit grower at Granger, Washington, secured seven thousand boxes of Winesaps and Jonathans which netted him \$1.50 per box, making a net return for one acre of \$1050.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co., Indiana and Yolo Sts., San Francisco, Cal.

Also Pioneer Manufacturers of High Grade Fertilizers.

Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

OLD HENS OR PULLETS.

THIS question is one that is asked us many times and especially at this time of the year. It is a question that has to be settled by most every breeder, for so many of us have a nice lot of well-matured pullets, so the problem naturally arises, shall we discard our old hens and depend on our pullets for laying this winter. This question, no doubt, has caused as much controversy and needless wrangling, as any problem that has to be solved by the beginner.

The primary cause of all this trouble is the attempt to make an arbitrary division of fowls into profitable and unprofitable producers, and draw the line at a certain age.

Profitable Age of a Hen.

This question, like the one of best breed, is a hard one to answer and as we have always said that there is no best breed, we might say also that there is no certain age when a hen should go to the block, as it depends upon the breed, strain, feed, care and management.

"There are many men of many minds Many birds of many kinds."

All are working under as many different methods and conditions, and a rule that that would apply to one age under the care, feed and treatment of one might be entirely wrong for a neighbor.

Generally speaking, when we refer to a hen, we mean from 16 months to 24 months old. Many of us don't keep our hens after they are three years old. A pullet, properly speaking, is a hen less than a year old. The period for which results are usually compared are from October or November until the following spring or early summer. At this season many of the early pullets are just beginning to lay. Many hens are not through the molt, so for the next 30 to 60 days the hens will not be at their best. We think it is better to give the flock a general overhauling in the fall and cull out those that are known to fall below the average as profitable layers. Do not leave any in the flock that you are reasonably sure are unprofitable, as every drone will cut down your profits, occupy room, take your time and attention.

Selecting Your Hens.

In all flocks of yearling hens are many that will not pay to keep over; many hens even at this age have outlived their usefulness, if they ever had any.

In selecting a flock we will divide them into three classes: Good hens, poor hens and medium hens, or hens that don't belong to either class.

To the first class belong those that are in good health and condition, bright looking and laying or about to lay. Hens that answer this description at this season of the year may be depended upon as being profitable. Those we have classed as poor hens are the ones that are not healthy, were not strong as chicks, were not good layers and are in poor condition.

The Indifferent Ones.

This leaves us some hens that don't

belong to either class. Many of them are good hens in poor condition; the point for us to consider is, can we by proper care and feed help their condition? Perhaps the most common cause for hens that have been healthy to be in a poor condition at this time of the year, is the constant strain upon their system caused by heavy egg laying. If these hens are put in a yard by themselves and given extra care and feed, we think the egg yield will be all that can be desired of them although it may be small at first. Yet, when fed back to condition, will lay most of the winter.

It certainly does not pay to keep hens over that are idle from one-third to one-half of the time, but we should think twice before we discard those that have proven themselves worthy of their keep for untried pullets.

AROUND THE YARDS.

If you raise scrub stock you may expect scrub prices.

Get your eyes on the good layers and the hatchet on the poor ones.

When molting show birds keep them under cover.

A poor little child of the New York slums in the country for a week, was found gazing with passionate interest at a lot of hens, and was asked if he had never seen chickens before.

"Oh, yes, I've seen 'em before," he answered; "but only after they were peeled."

Hens are never so happy as when they are knee-deep in straw and chaff digging for kernels of whole wheat oats or corn. This happiness is what makes them profitable, too. You never saw a hen that would lay many eggs if she were not happy all the time. It is the happy folks that do the world's business, anyhow.

Investigation of the capacity of hens to lay eggs results in the discovery that the egg production of hens decreases considerably after the age of four years. Thus, a hen lays at the age of one year about twenty eggs; at the age of two years, about 120; at the age of three years, about 135; at the age of four years, about 115; at the age of five years, about 80, and at the age of six years, about 60.—Successful Agriculture.

As a rule, extraordinary laying hens, particularly in their second year, will lay right up to the end of autumn or beginning of winter, and then molt, says Morgan Bates. Such hens require a little extra care at this time and usually come on to lay again in February. After they have been resting, the germs are stronger and generally the first few dozen of eggs laid will be fertile.

Various Questions.

1. May I ask, which is the best way to feed skim milk, while sweet or let it curd? 2. How is curd or bran mixed until it forms a crumbly mash for young stock, fed once a day? 3. Is it fattening or muscle, or bone-making food? 4. How would it do fed to laying hens? 5. I feel

im milk to my hens in a large ough which I leave in the sun; is at a good way, or should it be in e shade? 6. Is there much dan- of disease germs spreading that ay? 7. I would like to breed some oroughbred White Leghorns; ould you advise me to buy a trio of rds, or eggs and hatch them in an cubator?—Lloyd E. Edwards, West- inister.

1. Feed while sweet. 2. We ould rather feed milk while sweet ixed in a mash with brand, than to t. it curd. 3. We would consider ore a bone and muscle food, than ttening food. 4. If fed once a day ould be good for laying hens. Keep trough in shade and keep ean. 6. Not if your flock is althy. 7. If you are running an cubator and understand it, I would y eggs, or buy day-old chicks.

Wind Tumor.

I have a four-months-old Barred ock that has the skin on one side ery much puffed up with wind. hat is the cause and remedy? ave had small chicks affected the ame and they always died. We ould not discover any other com- lant. The one now affected has a old.—T., Santa Rosa.

No satisfactory explanation has ver been given. It accumulates nder the skin and forms a "wind umor" the size of a walnut. Rem- ly: Pick with a pin and allow the ir to escape. If it accumulates ain make a small incision with a arp instrument and annoint well ith vaseline.

Baggy Crop.

What is the cause of the bagged rop among my chicks? Largest es are the worst. Where can I et the Cornish Indian game?—Sub- riber.

Baggy crop is one symptom of ca- rrh of crop. Other symptoms are ffensive liquid and gases in the crop, nd the belching of the bird. There re several causes; among them is aking into the crop undigestible sub- jects, overloading crop, eating de- mposed meat, etc. Treatment: he crop should be emptied by hold- ng the bird by legs, head downward nd gently kneading the organ, forc- ng the contents out through the outh. Keep the bird without food or twelve to eighteen hours, and en feed lightly of easily digested ods. As soon as crop is emptied ve one grain of bicarbonate of soda nd one and one-half grains of sub- itrate of bismuth, in a dessertspoon f water once a day for three days. Write John D. Mercer of this city, or Cornish Indians.

Rheumatism.

Kindly tell me what is the matter ith my hens and how I can cure or op the trouble. They are Brown eghorns, one and one-half and two nd one-half years old and about 50 e lame. Some get well, but a num- ere die. They are regularly fed hree times a day, soft feed in the orning, chopd cabbage at noon and heat in the evening.—A Subscriber.

Either your birds have Bumble oot or rheumatism, as either will ause them to go lame. Bumble oot is caused by a bruise on bottom f foot, caused by constant confine- ment upon hard floors or runs, or by umping on hard surface from high erch or roost; if this is the cause ou can easily tell by examining oot. We rather think the trouble s of a rheumatic nature. Fowls are usceptible to rheumatism when ex- posed to cold and dampness, filthy nd poorly ventilated houses.

Treatment: Give 25 grains of Ep- om salts and put 35 grains of bak-

ing soda in each quart of water. Give two grains of salicylic acid twice a week until cure is affected.

They Don't Lay.

Can you tell me why my 125 hens do not lay better? They are full-blooded White Leghorns and perfect- ly healthy; are not troubled with mites, lice or fleas. I feed them a mash in the morning of Midland- Egg and Feather Food, about eight quarts mixed with water till crumbly, and in the evening about ten quarts of Egyptian corn and wheat mixed. They have green alfalfa to run to and I often give them green stuff out of the garden besides. I killed one to see if I could find a reason. She had about one-fourth of an inch of fat over her bowels and about a dozen eggs the size of a pea, all others smaller. They lay from three to eight eggs a day. They did not lay a year ago or through the winter, and we thought we had fed them too much grain while molting, so made them too fat.

They are not old. About 40 of them are only a year. Of course this isn't the time of the year for them to lay their best, but they ought to lay better than they do. They have plenty of good water and oyster shells, also meat when I can get it. Many times in the fall and winter I give them oats and cracked corn. I think I shall sell them down to 75. Won't you please give me the exact rations for that number? They run at large, but seem to lie around in the shade most of the time and do not act hungry only at meal times.—T. W. C.

We think you are feeding your fowls too much. Two ounces of feed per hen is enough for a bird at each meal. You ask for the exact amount to feed 75 hens. This is an impossi- bility; just as much as it would be for that number of persons; while I say two ounces is enough for any hen, yet some might do better on less and some might require more. The best way is to feed just what will be cleaned up at each feed; never allow food to lie around. The most satis- factory way of feeding laying hens is in hoppers or dry feeders; get some one of the well-balanced egg foods and put in a hopper dry.

We note what you say in regard to reducing your flock. When you do, take care to keep the layers or those about to lay. If you have no other method of culling, you can tell pretty well by watching for three days all that are found on the nest put in a yard, and those that don't lay once in three days sell. That, of course, applies after your birds have started to lay, and they ought to start before long. You may expect your birds to stop laying for a while during and following the molt.

A PROFITABLE LITTLE RANCH.

Since writing last week's article, we had the pleasure of a visit to a ranch containing about four acres, two acres of which was run to poul- try. This two acres contained the house and yard and feed house, barn, etc., so in giving our figures as to what Mr. and Mrs. Coles, (for this is the ranch we refer to) are doing, we will designate it as a two-acre poultry ranch.

We give what was done on this farm or ranch in one year, as Mrs. Cole was just figuring up her year's receipts when we were there, the year having ended the day before our visit.

Plymouth Rocks.

The birds kept on this ranch are thoroughbred Plymouth Rocks, Barred and White, and most of the product, (stock and eggs) was sold on the market, yet they sold some stock for breeders and settings for

Hen Fruit Pays. If you want more, feed

Egg-More

Poultry need to be fed a scientifically balanced ration as much as any other stock. Egg-More is just the thing to mix with good grains to make the same a rightly balanced ration. It is highly nitrogenous, very rich in protein, will keep the hen in good health, sustain her system properly, and enable her to lay lots of eggs when they are scarce and high. Just a little fed daily with good grains, or even with bran, as directed with each package, will do it. It can be fed either dry or as a mash. It contains no cheap filler; the hens like it, they eat it, there is no waste. It makes the cheapest Egg Food especially if you can buy your grains at home cheaper than to ship them in. Many so-called "poultry foods" and "egg-makers" are nothing but stimulants and not advisable to be fed regularly. Egg-More is not a strong tonic and stimulant, but merely contains enough condiments to give the food relish and keep the fowls in fine fettle. It will pay its cost many times over in the increased egg yield. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

hatching, also some day-old chicks,
as they did not neglect an opportuni-
ty to convert their products into
cash at the highest price obtainable.

On September 23, 1906, there were
on the ranch 710 head of poultry all
told, and at the close of the year,
September 23, 1907, 730 head or 20
head more than a year ago.

Strict account was kept of every
item paid for feed and every head of
stock and every egg sold during the
12 months, excepting only, that used
on the table and given away.

Stock sold amounted to, \$303.57;
eggs sold, \$1268.05; total, \$1571.62.
Paid for feed, \$667.10, leaving for
their work a profit of \$904.52.

At no time during the year did the
number of laying hens exceed 325.
The others were birds of various
sizes and ages, but not in the yards
with the breeders.

PURE BRED POULTRY.

It is surprising to look over the
farms and see how few flocks there
are of large sized, productive, uni-
formly well bred birds. It costs no
more to raise a nine-pound pure bred
fowl than a five-pound mongrel and
the former will lay more eggs than
the latter. The house you build for
mongrels will do just as well for
thoroughbreds; your time spent car-
ing for them is worth more. The
average farmer who does not believe
in thoroughbred poultry would not
think of paying a fair price for a
setting of eggs, or making an outlay
for a few nice cockerels to head his
flock. As a result, the flock of poul-
try is a hodge-podge of all types and
colors. There are Barred Rocks with
rose combs and feathers on their
legs. They are "just chickens." How
different it is to look upon a
flock of thoroughbred fowls. The
birds are all the same in size and
color. They act the same. There is
something in the scene that gives
one a determination to take more
pains with his own flock. Become
thoroughly acquainted with the
strain of your birds. Aim to make
them as nearly perfect as possible.
There is always a demand for eggs
or fowls from a good breed.

How much more profitable it is to
receive from \$1 to \$1.50 each for sur-
plus cockerels than the common mar-
ket price of 40 cents or 60 cents each.
How much better to sell eggs at one
to two dollars per setting than to re-
ceive 12 to 15 cents per dozen at the
stores. What is desired by many
farmers is a strain of vigorous birds
true to their type but not high class
show specimens. Every farmer
should have a sufficient amount of
pride to take the extra trouble to
maintain, at least, a moderate degree
of excellence among his fowls. Well
bred birds are attractive anywhere.
They will outweigh the mongrels;
they have proved to be better layers.

Farmers may profitably purchase
birds or eggs from a strain of pedi-

greed laying fowls. No great amount
of money need be expended. A few
well bred birds or a few settings of
eggs are all that are necessary.

THE AMATEUR POULTRYMAN.

The amateur who is just starting
into the poultry business must be
willing to begin at the bottom and
work up. He will encounter many
obstacles, but if he has a sufficient
amount of stick-to-itiveness in his
makeup he will succeed. His rise
may be slow, but there is room at the
top. The mushroom poultryman is
short-lived.

The selection of the breeds neces-
sary depends upon the kind or kinds
of products desired.

If egg production alone is sought
then some of the Mediterranean
breeds are to be selected.

If meat alone is the desideratum
the selection should be made from
among the Asiatics.

But if both meat and eggs are de-
sired, either two breeds must be se-
lected and maintained or the selection
must be confined to the American or
dual-purpose group.

The selection of the breed is im-
portant, but the maintenance of the
purity, vigor and health of that
breed is vastly more important.

If purebreds possess merit over the
scrub, the truth of which no well in-
formed person will undertake to con-
trovert, it would seem to be desirable
that the identity of the breed should
be maintained.

Therefore, the selection of the
breed must be followed by proper
methods in handling. Otherwise, the
the good results sought through the
selection of thoroughbred fowls will
hardly be realized.

General Agriculture

THE RUSH TO THE CITIES.

ONE OF THE most disquieting features of the social condition of our times is the rush of young men to the cities. Resulting from this is the weakness and inability of the farming population as compared with the same class half a century ago. Steadiness of national character goes with firmness of foot-hold on the soil. We may well look with alarm on a condition in which men of wealth and power shall be gathered in the cities, while the farms are left to the weak and inefficient or to the peasants of other nations. As matters are, the cities are great destroyers of human life. We have not learned properly to govern them nor to make them effective, and every city is full of human failures, results of misdirected effort. A tour of the principal streets, halls and meeting places on Sunday evening in any great city will show how terribly true this is. Certainly one-fourth the present population of such a city as San Francisco, for example, has no real business there. These people are doing nothing which is effective for themselves or helpful to others, and the condition of the other three-fourths, and most likely their own condition, could be distinctly improved if these misfit persons would go back to the farms.

No one can succeed in city or country unless he is able or willing to do some one thing well and to stick to it. Because the life of the country is simpler and more honest, it is easier for a man of moderate ability to get into it. I call it more honest because the farm life deals with nature at first hand, while the city life deals with the shifting relations of men.

"The farmer trades with nature through no middle-man. Nature is as honest as eternity and she never fails to meet the just dues of those who have claims upon her."

In the city, opportunities to gratify ambition are more numerous and greater than in the country. But opportunity comes only to the man who can make use of it. For a man who can do important things and can do them well, the city will always furnish something worthy to do. Hence, the success of thousands of men who have gone to the cities with their worldly goods on their backs and no capital but their brains.

But the great majority of those who leave the farms are not of this type. They have not learned to do anything well, least of all anything the people of the cities want. Hence the failure of those who go to the cities without capital of any kind, or with capital of other kinds than brains.

The great obstacle in the way of the effective working man is not organized capital. It is in efficiency. It is the great crowd of those who can do nothing well and whose presence causes a general scramble whenever there is any work to be done. Capitalists would and would double the wages of labor if they were assured of intelligent, effective and loyal service. Brains and heart are the only servants that a man can afford to pay for. If you cannot furnish one or the other of these, there is no help for you. You cannot live by the work of your hands. Least of all can you do this in the city where competition

is severe, and where three men are struggling for the chance to do the work of one.

There is no doubt that the congestion of the cities is in part the effect of the unwise legislation. We have used every effort to be something more than a nation of farmers, and in this effort we have almost ruined our farms. But legislative action is not the main cause of the congestion of the cities. The other causes are bringing about the same result in all civilized nations. Even Rome has had a "real estate boom," an unfortunate condition which arises as the people crowd into the capital. It is not clear what the end will be or how the evil will find its remedy.

But this we may say to every

farmer's son: You have your own life to make. In the country you are sure of your ground. You will get what you deserve. While your rewards may not be brilliant, your failure will not be ruinous. Do not go to the city unless you are sure that the city needs you. If you go there with nothing to give that the city cares for, you will find yourself cast aside. Brains the city wants and will pay for and devour. Loyalty of service will be recognized and valued in this world or any other. Handwork pure and simple, without skill or pride in it commands no price in the market. There is no chance about this. The results are sure as fate. If you do poor things poorly, you will always be poor. What you can do, a bucket of coal and a bucket of water, guided by a thimbleful of brains will do more effectively. When the time shall come that each workman can

use his power to the best advantage, we shall have an end to the labor problem. The final answer to the labor problem is that each shall solve it for himself.

When you have solved the labor problem for yourself and are ready with the answer, then you can go to the city, and wherever you go you will find the success you deserve. If all men waited as you should wait before rushing to the cities, we should have no labor problem, no problem of municipal government and nothing to fear from the desertion of the farms or from the congestion of the towns. Learn to do something well. It will make a man of you, and wherever he goes a man will find that he is needed.—David Starr Jordan, in California Advocate.

Five fumigating outfits and thirteen spraying outfits are operating in Riverside county.

The Shape of a Plow

from the share-point back a third of the way across the mould board determines whether it pulls heavy or light. Three-fourths of the friction comes on this part, and this part of a John Deere plow bottom is shaped to split the ground like a thin wedge splits a stick of wood—that's one reason why John Deere plows are easy on your horses and economical for you—why the John Deere is the lightest draft plow in the world—and why there are more of them in use than any other three makes combined. We sell the John Deere plows, and carry a large stock of farm machinery. We want your business.

Profit

In Ninety Days For \$600

The Great Goose Lake Forest Reserve Opening

We will run weekly excursions in October to the greatest timber reserve in Oregon. First excursion starts in a few days. Only 50 more vacancies this first trip. Go up and locate a quarter section for yourself and for each adult of your family. If there are four in your family, you can secure a full section, worth from \$15,000 to \$20,000. You can secure the entire section at an expense of \$400 to the government for each quarter section and only \$200 to us to cover expenses of transportation, services in furnishing witnesses, guides, markers, etc.

You can sell your section after 90 days from date of entry and realize

A Profit of Ten to One You Don't Have to Live on These Claims

Anyone who is of legal age can take up a timber claim. The cost to you in securing a timber claim through us is as follows: \$200 to us for our services in making your location and assisting you in making your entry; \$2.50 entry fee to the government. Ninety days after the entry you pay the government \$398.50 and get your title. Total cost, \$600. After your title is perfect, you can sell your land with its timber for from \$4000 to \$5000 or sell the timber alone at \$1.50 a tree and average \$4000 to the claim.

Don't miss this great opportunity. Act at once. First comers get first choice. Our contracts are numbered in order.

Call or write. Open Tuesday and Saturday evening to 9 o'clock.

Queries and Replies

Onions.

Please tell me where I can get information about growing onions in California. I expect to put out about five acres and wish information as to tools, kind of seed, etc. I wish to plant five acres and if prices remain as they are now I expect to clear \$2500 a year. I prefer this to being where the steam whistle will call me to work for someone else, and where I will have to take my pay handed out in an envelope. No more of that for me. I propose to be monarch of all I survey. My right there—none to dispute, for I shall be master of the field and brute (if only five acres square.)

For I am weary of this strife for millions

And will hike "to the country and and go to raising "onions."

Please don't class me as an agricultural poet

For very soon my hands and feet won't show it.

My city friends think me foolish and wanting common sense

But I tell them wait and see my onions on the other side the fence.—W. A. D., Monrovia.

Our advice to our friend would be to go easy and not too fast in planting his full five acres the first year. It will take some hard work and water and a whole lot of experience to pull through five acres of onions and from the tone of our friend's letter, we take it his experience is very limited in the raising of onions. First, we would study conditions about Monrovia and find somebody who has made a success under the soil and climatic conditions of that section and learn the variety best adapted. Right ground should be secured and plowed, after which it should be put in thorough tilth to receive the seed. As to its future care, we quote from California Vegetables:

After seeding, thorough, shallow cultivation is essential. Do not wait until the plants are up before beginning; from four to eight days will be proper, or when the seed begins to show signs of germinating, which can be ascertained by carefully brushing the soil from the drill row. I put the curved hoes on my wheel hoe, with the straight ends of the hoes pointing inwards and lapping about two inches and hoe right over the rows, but not deep enough to disturb the seed. It saves a great amount of hand weeding by killing the weeds just starting to grow in the rows. As soon as the onions are up sufficiently to follow the rows, I reverse my hoes with the curved ends next to the rows, just far enough apart so as to hoe as close as possible without cutting the young plants by running the hoes astride the rows. This operation hoes both sides of the row at one trip of the machine. Follow this by hand weeding; this operation is best performed by the crawling process, that is by getting down on hands and knees astride of a row and pulling every weed in sight, and loosening the soil around and between the plants. Repeat this as often as any weeds are to be found, and under no circumstance allow the weeds to grow above the onions; at the same time keeping the wheel hoe at work between the rows and as close as possible.

As previously said, the bulb of the onion should be at the ground surface, and the dirt should not be thrown to any extent on the onions by cultivation. The roots should be well covered, but not the bulb.

Fertility in Soil.

Please answer how can I tell whether there is sufficient potash, lime, or phosphoric acid in the soil?—Mrs. F. E. S., Atwater.

The best way is, perhaps, by actual experiment. That is, by planting of check rows of your crops, some without any potash, others with potash. If where the potash is added better results are obtained, it is fairly evident that potash is needed. The same with the other elements. However, if you should wish an analysis of the soil, write to the Agricultural College, University of California, Berkeley, and ask for blanks which will give you instructions how to take a sample of the soil to send to the University, which, when received, will be analyzed and you will be furnished with copy of the analysis.

Frost Protection.

Will you kindly give some items in regard to smudging citrus trees to prevent damage from frosts?—Old Subscriber, Corona.

Smudging has practically been superseded by the heat process; that is, by building fires that create sufficient heat to raise the temperature. The smoke proposition used as a "blanket" to hold in the latent heat was found to do some damage by smutting the fruit and but little good in holding the heat. The form of fuel mostly used has been briquettes largely manufactured in Los Angeles, and sold very cheaply. With properly constructed stoves these give the largest amount of heat for the least amount of money.

Book on Horse and Cattle Breeding.

Please tell me where I can secure the best treatise on breeding and raising horses and cattle.—Subscriber, Corona.

If you wish general information on various breeds of farm animals "Types and Breeds of Farm Animals" by C. S. Plumb of Ohio State University will give information. This book is published by Ginn Co., Boston, Mass. Same firm has also in press "Principles of Breeding." As to feeding animals "Feeds and Feeding" by W. A. Henry of the University of Wisconsin is one of the very best. Either of these books can be supplied from this office if desired.

Onion Seeds or Settings.

I would like your advice as to planting onions near Antioch, Contra Costa county. Would you advise sowing seed or putting out settings, and at what time would you plant? How many seeds will it take to the acre, and what kind of onions are best?—Miss H., Lodi.

Planting with seed will be cheaper, of course, and will require about two months longer to secure a crop. Hence you will probably be governed as to when you wish to reach the market. Seed planted now will probably give you your crop ready for the market in March. If you plant seed, the most common method of culture is to drill seed thick in the rows quite shallow, and rows from 12 to 24 inches apart. After plants are as large as pencils, thin out to about three or five inches, according to the variety, transplanting those taken out to about the same distance, after cutting back the tops and roots, or they can be

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Congo Roofing

is proof against decay because there is nothing in it that can rot

It is proof against water because it contains nothing which is soluble in water.

It is proof against heat because there is nothing in it which even the tropical sun can soften.

It is proof against cold because there is nothing in it which even the climate of Alaska can freeze

It is proof against leaks because it is so pliable that anybody can lay it right, fitting it tight and snugly around the chimneys and valleys.

It is proof against dissatisfaction because it is made to endure and people who once buy it, buy it always.

grown thickly in beds and transplanted to rows. Can be sown any time of the year, and really there is no excuse why fresh onions cannot be had every day in the year.

As to varieties, gardeners in the immediate vicinity in which you wish to plant would be the best authority, but if you wish to have something extra fine the "Crystal Wax" the seed of which is now \$1.00 per pound, is fine.

Pruning Peaches.

It is best to prune peach trees before or after the early spraying in December?—A. L. P., Sanger.

For sake of economy would advise early pruning and spraying after brush is cleared away.

Paspalum Grass.

In answer to a dozen or more queries as to Paspalum grass, about

which an article appeared in the Cultivator of August 22d, we may say that we have written to the author of the article in New South Wales, also the Department in Washington, and others qualified to give more complete information.

The statements of that article would indicate this grass to be an extremely valuable one in Australia, and if it is found to be advantageous to California, and in no way in danger of coming a pest, as Bermuda grass is, may prove well worth introducing.

Rich Feed.

I have a colt that is continually baling. Is in good condition and its. I cannot find any vermin on it, but small lumps rise upon her when she rubs them raw. Can you advise what is wrong with her and remedy?—W. I. Y.

Our filly is fed too high; cut down the feed a little and give her Ep-salts in feed daily, about three teaspoons at a time. Externally wash thoroughly with soap and water. Then sponge over with the following: Water, one quart; euphorbia, three ounces; a few applications will affect a cure.—W. J. Oliver, V. S.

Guernsey Cattle.

Please give information as to whether there is any Guernsey stock in Los Angeles.—S., Dulzura.

The J. M. C. Marble Co., of Los Angeles, has the largest herd of Guernsey, we believe, in Southern California.

Johnson Winter Rhubarb.

Can you tell me how long the stalks of Johnson Winter rhubarb grow?—L. H., Long Beach.

I have seen rhubarb stalks three feet long and as large as a child's arm. On the other hand, from the seed of the true Crimson Winter there are plants which would not produce stalks more than a few inches in length and very small. In fact, the seed from Crimson Winter gives plants of great variety, and some can be raised under any form of culture, be they raised into giving long stalks. By proper selection and great care in raising up, we believe large stalks

Veterinary Instruments, Black Leg and Trax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

may be produced on the greater portion of the plants. However, we believe this prevails on the higher colored, and some think that the better flavored stalks are not those of the greater size.

High Headed.

I have an Orange Cling peach tree. I think it is twenty feet high and is twelve years old. We thin it every year, but it is too high. How much and when can we trim it down?—C. A. R., Riverside.

It will be hard and probably impossible for you to make a fruit tree of that age into a low-headed tree, but then it can be helped some by pruning back heavily during the dormant season, which will be two or three months later. This heavy cutting back will probably reduce your fruit for the first year, but will give a new top which will give a larger amount of fruit than you are now securing. Instead of cutting out entire top, occasional limbs may well be taken the first year, with balance of tree next year.

Trimming Back Peaches.

Is it proper to cut back or head in peaches at this time of year, or should I do so later?—L. L., Selma.

It will be better to defer your pruning until the tree is entirely dormant, either in December or January. Then if it is a young tree, cut back two-thirds of the present year's growth. Where dense, thin out some of the old growth. Also cut out cross limbs and others which throw the tree out of balance.

Planting Peas.

When can I plant edible peas?—B., Pasadena.

Peas are planted anywhere from the 1st of September to the 1st of June. A great many of them are being planted at this time, as they will be ready for use about Christmas time.

Planting Eucalyptus.

I have a few thousand red gums (E. Rostrata) which were planted too late for last year's setting and are now from two to four feet high. At what time of year can I remove them from the seed bed to the field, and should they be cut back when set.—An Easterner.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

We are afraid our new friend has allowed his plants to get beyond him, and that they have become too large to be transplanted safely. Transplanting younger at this season of the year, unless in sections of very light frosts, would be attended with considerable risk, but in any case transplanting of Eucalyptus trees two to four feet high will have to be done with the greatest skill to make them live. They should have been taken from seed bed and put in pots or cans when but a few inches high, from which they could now be transplanted to the field with practically no risk. If they are now in the seed bed far enough apart so that quite a ball of dirt can be taken with each, it is

possible they may be satisfactorily removed at once. Of course it is barely possible, by cutting back heavily and moving the bare roots, some may be made to live, but we fear only a small portion. Now is a good time to sow seed for next spring's planting.

Onions.

Another query regarding onions has been referred to Mr. Lobingier, who will give us an article on planting and care of onions at some later date.

A number of interesting queries are necessarily crowded over till next week. Next week's query pages will be worth waiting for.

Your Confidence

Can only be merited by Honest Business Methods

We have confidence in Los Angeles and its people and wish to hold your confidence by our straightforward and honest dealings.

The system of unreasonably high pricing and the marking up of prices to provide for great special sale reductions has long since been practiced in Los Angeles and has been the means of unloading much poor and undesirable furniture to parties who believed they were making a genuine saving. In most of such cases you are paying at the sale price more than you would pay in a reliable store at the regular price.

WHAT CAN YOU DO?

That's what the world is asking you.
Not who you are,
Not what you are;
But this one thing the world demands—
What can you do with brain or hands?

What can you do? This is the test
The world requires; as for the rest,
It matters not,
Or who, or what
You may have been, or high or low,
The world cares not one whit to know.

What can you do? What can you do?
That's what the world keeps asking you
With trumpet tone,
And that alone!
Ah, soul, if you would win, then you
Must show the world what you can do!

Once show the world what you can do,
And it will quickly honor you
And call you great;
Or soon or late,
Before success can come to you,
The world must know what you can do.

Up, then, O soul, and do your best!
Meet like a man the world's great test.
What can you do?
Gentle or Jew,
No Matter what you are, or who,
Be brave and show what you can do!
—The Watchman.

MISS TREVOR'S WARD.

"ARE WE quite through with mail, Miss Trevor?"

The young woman at the desk by the window looked up.

"Quite through with your share of it, Mr. Renwick. My share is a little larger than usual." And she bent again to her task.

He pointed to the package before her. "And those are all begging letters?"

"Most of them are begging letters. A few are merely annoyances."

The old man sighed. "It's strange how they persist in writing. They must know I never give indiscriminately. Perhaps the same sort of fever impels them to write to me that allures them into buying the lottery tickets. And you don't find one among them makes an honest or a worthy appeal?"

"Not one, Mr. Renwick."
"I trust you are not getting hard, Miss Trevor. You are too young to be cynical."

"I don't think it's going to hurt me, Mr. Renwick. You have asked me to stand between you and these letter writers. It hurts me a little to find there are so many people who are willing to humiliate themselves, but I know that honesty and independence and pride still exist in the world, and that I am simply doing my duty when I deliver you from beggars and sycophants."

The old man watched the quick fingers working as the girl filed away the letters.

"What is your ambition, Miss Trevor?"

He had a way of speaking out abruptly, and his question did not surprise the girl. "To give my mother a good home, and to lay by something for the rainy day that we talk about and never expect."

"A modest ambition," said the old man. "But have you never thought of marriage and a different sort of home?"

A soft flush tinged the girl's cheeks. "I am thirty," she answered, "and quite hopeless."

He shook his head. "Then you are wilfully hopeless. But you have thought of it?"

The flush deepened. "Years ago," she murmured. "I was quite young. It was all like a dream. The wedding day was set. He never came."

The old man frowned darkly. "You were well rid of him," he growled.

"I tried to think so, but it was hard, very hard. I'm afraid it robbed me of some of my faith in humankind."

"Because one man played you false," cried the old man. "That isn't fair. And did you find out what drew the unworthy fellow away?"

"It was another woman. I heard the story afterward. He had been wavering between us. It was the other woman who won." She sighed. "I was only twenty then."

The old man eyed her keenly. "I fancy," he said, "that you are a great deal happier today than you would be if you had married that unworthy fellow."

"No doubt that is true," she answered. "Yet somehow I can't help wishing that I had won him—instead of the other woman."

"The eternal feminine," muttered the old man. But there was no sarcastic chill in his words.

"I don't know why I have told you this," said the girl presently. She hesitated. "I think it must be because this is the anniversary of the day that should have been my wedding day."

Her face was hidden from the old man. Her eyes were on her work.

When he spoke his voice was very gentle. "You have paid me a compliment by telling me," he said. "I have won such a reputation for hardness that I am grateful to know that someone can treat me as a sympathetic friend." He paused.

"You speak of an anniversary," he said. "I am included to look upon it as the anniversary of your deliverance. You give it a more sentimental significance. That is natural. But it has just occurred to me that you might want to mark it in some practical way. Perhaps by helping a needy sister. Perhaps by making marriage possible for some worthy pair. You will know how to use this remembrance. Miss Trevor, you and I have given away great deal of money—and you have saved me many times from giving unwisely."

The girl looked up.
"You are very kind, sir," she said, "and very thoughtful. But just now I can think of no way to—to utilize your suggestion."

"The way will undoubtedly be made clear, Miss Trevor. Let me know when you find it."

He leaned back in his chair again, half closing his eyes. His thoughts were busy with the past. There was a girl—yes, she was very like this girl. Her hair was brown, her eyes were dark and serious. He had fancied her as a boy, and when he grew to manhood his dearest vision—he had visions then—always placed her by his side. But he was too poor to think of marrying, and she wedded the son of the rich miller—at least he passed for rich in those dull days.

The old man grimly smiled. He could buy the rich miller a thousand times over. And yet in that day he would have looked upon \$500 as a fortune. With \$500 he would have dared to ask the girl to marry him. Very likely she would have refused. Perhaps it was all for the best.

The girl looked up. "I beg your

pardon, Mr. Renwick," she said, "here is a letter that is puzzling. I am a judge of such things, it is an honest letter, and yet somehow worries me."

"Let me hear it."
"It purports to be from a child. I feel quite sure it is inspired by older head." She spread out the crumpled sheet.

"Dear Mister Renwick, I am a little boy, and nobody knows I'm writing this to you, 'cause papa and mamma are both too proud and would be very angry if they knew I was writing. Papa had money and we were so happy, but he sign a paper for a friend and the friend was not an honest man, and papa lost all his money. And now papa has rheumatism in his hands and he find it is hard to get work, and mamma hasn't been well since baby Joe died and the rent is three months due and the man says we must pay or leave and I haven't any shoes to wear and mamma cries most all the time. Please, can't you help us with a little money, dear Mr. Renwick, 'cause we are so poor and very worthy. I hear papa say that if he had \$200 it would put him on his feet again. It would be so little to you and so much to us, Mr. Renwick, and I would pray for you every night. Please send soon to 29 Court alley, upstairs, back room to Mister James Desmond. That's papa and I'm little Jack."

The old man nodded. "Quite evidently a fraud," he said. "Little Jack piles it on too thick. Why let it worry you?"

The girl faintly smiled.
"I don't know why it should," she answered. "But it does." She hesitated. "I think," she said, that I will investigate it personally, this evening.
"Court alley," mused the old man. "That's not a savory locality. I will send Brown with you. He will talk with the motor car at 7:30."

When the old man entered his office the next morning the girl was at her desk.

"What did you find out, Miss Trevor, concerning the boy and the letter he wrote?"

"Quite enough, sir. The people were what I expected. The man is a vagabond, and the woman a poor creature with an appalling taste for strong drink."

"And the boy?"
"There is a boy, but he isn't related to them. The boy is better than his surroundings. He told me the woman made him write the letter and send it to you. The boy is an orphan. His father died four years ago, and his mother a year later. His only home since his mother died has been with this wretched pair."

"He should be taken from them," said the old man.

"I have arranged to take him," the girl responded. "I bought him from the people. He will be brought here this morning."

"And what will you do with him?" the old man asked.

"I mean to adopt him."

He drew down his thick gray eyebrows.

"Isn't this a great responsibility?" he gently asked.

"I have no doubt it is, but I mean to assume it."

A clerk appeared in the doorway. "Beg pardon, sir, but there is a child here asking for Miss Trevor."

The girl sprang up. "It is the boy," she said. "May I—may I bring him in?"

He was a handsome little fellow of

at years, with thick brown hair and brown eyes. His clothes were shabby, but his face was clean and his curly hair was fairly smooth. Mr. Renwick, this is Jack—Jack Ainslie."

"How do you do, Jack Ainslie," said the old man, and took the boy's hand.

The boy looked at him with frank surprise.

"Did you get my letter?" he asked.

"Yes."

"She says it was naughty to write. But I wouldn't if Mother Desmond hadn't told me. Why, I didn't even have a postage stamp."

"We understand, my boy. And so you are going to have a new home?"

"Yep, I'm going to live with her," he told me.

"And you are going to try to deserve all her kindness?"

"He nodded. "Yep. I'll bet she ain't the kind that knocks kids around. She's mighty good to me."

The old man raised his head with a quick smile. Miss Trevor was gazing at the boy with an expression on her face that he had never seen there before. For the moment it seemed to him that she was beautiful.

"He caught his wondering glance and smiled. "That will do, Jack," she said. "You may sit over there until I can take you away."

Miss Trevor came a little closer to the old man's desk. "You may remember that I told you that yesterday was an anniversary?" she said to him in a low tone.

"Yes," he answered, "I remember."

"He drew her breath quickly. "This is his son."

The old man looked up. "The son of the man who was unworthy?"

"Yes. There is no mistake about it. He bears his father's name. He is his living image. They were very dear and very unhappy."

"He paused and looked away.

"And this is why you want to adopt him?"

"Yes."

"He looked at her for a moment. "I remember right, he gently said, suggested that you should mark the anniversary by some special act of kindness. You have done so—now I ask you to let me add my share." He made some figures on the paper pad before him. "I propose to put this amount in the bank as a Jack Ainslie fund," he said, "with Mary Trevor as sole trustee. I think the same will be quite sufficient to support and educate your ward until he reaches of age."

"He drew aside his hand so that she could see the figures. The tears rushed to her eyes, her lips trembled.

"Thank you," she murmured brokenly. Then she turned quickly and went back to the boy.—W. R. Rose, in Ireland Plain Dealer.

LITTLE HELPS BY THE WAY.

"You worsted in the fight?"

"Laugh it off."

"You cheated of your right?"

"Laugh it off."

"Don't make tragedy of trifles, don't shoot butterflies with rifles—"

"Laugh it off."

"Does your work get into kinks?"

"Laugh it off."

"Do you near all sorts of brinks?"

"Laugh it off."

"If it's sanity you're after, there's no recipe like laughter—"

"Laugh it off."

—Old Epitaph.

RECIPES.

Green Tomato Pickle.

Two gallons green tomatoes, sliced without peeling; twelve good-sized onion sliced; two quarts vinegar; one quart sugar; one tablespoon allspice; one tablespoon ground mustard; two tablespoons black pepper. Mix all together and stew until tender, stirring often to prevent scorching. Put up in small glass jars. This is a pleasant sauce for almost every kind of meat and fish.

Chili Sauce.

Twelve large ripe tomatoes, two large onions, three ripe or two green peppers, three cups vinegar; two tablespoons of sugar, one of ginger, cloves, cinnamon, allspice, two of salt; boil until it thickens. One quart of canned tomatoes may be used instead of the fresh ones.—M. P.

Egg Gems.

One cup chopped cold meats, one tablespoon melted butter, one cup bread crumbs, salt and pepper. Mix together the meat and bread crumbs. Add the butter, salt and pepper, and enough milk to bind together nicely. Fill well greased gem pans with the mixture. Break an egg on top of each, season with salt and pepper, and sprinkle with cracker crumbs; bake eight minutes.

Escaloped Potatoes.

Melt a small piece of butter and two very thin slices of cheese in a frying pan; bread in the number of eggs you wish to use; drop small pieces of butter over them, season with salt and pepper, then sprinkle thickly over the top nice bread crumbs; place in the oven and let remain until the yolks are of a jelly-like consistency; serve at once.

HOMELY HINTS.

A piece of pumice stone is the very best thing to scrape and scour iron kettles, or any utensils that will not be injured by scratching.

When ants are troublesome sprinkle sugar through a small piece of sponge and leave these about the pantry shelves. In a short time the ants will be holding a high carnival. Plunge the sponges in boiling water and set again.

A good remedy for keeping moths out of furs and woolen pieces is to wrap the fur tightly in a piece of newspaper that has been soaked in turpentine.

Place in an old pillow case or bag. There is absolutely no danger that the moths will disturb any piece so treated.

When ivory handles have turned yellow rub them with turpentine and it will very shortly restore their color.

To prevent hardwood floors from being marked, put pieces of thick felt the exact size of the tips of the chairs and fasten on with a strong glue. The felt is far less expensive than rubber tips and will wear much better. Rocking chairs may have a long narrow strip glued on.

PROPER SIZE.

"Yes," said the conscientious dealer, "this hammock will hold two persons, but it will be a tight squeeze."

"Oh, that will be all right," replied the blushing maid. "Just send it around to the house and charge it to papa, please."

To cleanse the hair and promote its growth, rub the yolk of an egg well into the scalp and rinse out thoroughly with warm water.

The Produce Markets

LOS ANGELES, Oct. 9, 1907.

Butter.

An increase of 7½ cents per roll on extra creamery butter gives an interesting tone to the market this week. The trust is responsible for it, say the dealers, but sure it is the sales are held firm at quotations.

Creamery extra per roll... 72½
First... 65
Dairy... 48
Cooking... 45@47
Eastern... 55@57½

Cheese.

Cal. Young America, per lb... 19

Eastern... 17½@18
Imported Swiss... 32
Tulare flats... 18
Domestic Swiss... 21@22

Eggs and Poultry.

No change in eggs during the week. Receipts of fresh local stock were a little under the average and this would undoubtedly have caused an advance but for the free movement of Eastern eggs out of cold storage. Eastern egg-operators state they have never known of a time when the storage egg movement was so rapid.

Eggs local candled... 38@39
Eggs case count... 34@37
Fresh Eastern... 35

Barley... 1.45
Corn Eastern sacked... 1.70

Feed Stuff.

Kaffir corn and Egyptian corn are now practically out of the market.

Selling price F. O. B. Los Angeles as follows:

Cracked corn... 1.75
Shorts... 1.45
Bran... 1.30
Oil cake meal... 2.50
Feed meal... 1.80
Rolled barley... 1.60
Rolled Barley per ton... 32.00

IT'S PENNY WISE.

Policy to set out a good tree, costing good money and then let the sun burn the bark or the rabbits gnaw it when for \$1.00 an acre you can get Yucca Tree Protectors that are practically indestructible. Write for free sample of the wrap. Yucca Manufacturing Company, 1380 Willow Street, Los Angeles.

BETTER THAN EVER.

It is gratifying to note that great as was the San Francisco disaster, many of the old time, familiar names still remain on the signs over the big houses. One of these names is that of Woodin & Little, which was for years familiar on lower Market street. The firm is now located at 534 and 536 Mission street between First and Second. There a bigger and better stock of pumps—especially the Gould, which has been a winner—also of engines is complete.

The years of experience of this firm in handling these goods is worth much to the purchaser. A letter to such a firm expressing your needs will bring valuable information. Ask for Catalogue A.

San Francisco Markets

Vegetables.

Bell peppers have become scarce and an especially strong market holds them. Tomatoes are in oversupply and are unsteady. Cannery get them want for 25 cents a box. Cucumbers are on hand in moderate quantities and though rather stale, are moving more freely. Green peas were light supply and some shipments, from Halfmoon Bay, failed to appear. Small lots of green corn came in, sold according to its quality from \$1.50 to \$1.75 a box. Brown Australian onions are in heavy supply and strong demand is taking them at 6 cents a pound.

TO MAKE GOOD COOKING BETTER.

Here is something that should have prompt attention at the hands of everyone of our readers. A valuable cook book containing hundreds of choice recipes and other kitchen helps, to be sent free to our readers, on request.

The Enterprise Manufacturing Company of Pennsylvania, 240 Dauphin Street, Philadelphia, has just gotten out a new and up-to-date edition of their valuable cook book, "The Enterprising Housekeeper." The regular price of this book is 25 cents, and it is well worth it, but everyone of our readers can get it absolutely free, simply by writing to the Enterprise Manufacturing Company and asking for it.

Those of our readers who desire a copy of "The Enterprising Housekeeper" should get their request in as soon as possible. Though the edition is a large one, it may be exhausted.

INCUBATING OSTRICHS.

Editor Cultivator:

We feel a degree of pardonable pride in advising you of the receipt of a cable order from South Africa for forty—Model 83—O—"Petaluma" Ostrich Incubators.

A few years ago Mr. Colenso, who is a half owner in a large ostrich farm in South Africa, visited California and saw how successful the California ostrich farmers have been with "Petaluma" Incubators in hatching those large eggs. The above named gentleman ordered two "Petaluma" Incubators for ostrich eggs made and shipped to his farm; since which time we have made many ostrich incubators for that country, the latest order being for 40 machines.

No other incubator can so successfully handle those large eggs, and ostrich farmers have repeatedly written us that they would not risk putting such valuable eggs in any other than the "Standard of the World" "Petaluma" Incubators.

Petaluma Incubator Co.

IN SPANISH.

The Germain Seed Co. is out with a catalogue, the illustrations of which are profuse, very clear and intelligible, but for the reading matter we have but little use though it is doubtless all right. We note that it is a "Lista general de Semillas de Primer grado." It seems to be complete from "vegetales" on the first page to the "Colecciones de bulbos."

In other words it's the Germain Seed and Bulb catalogue in Spanish printed to meet the ever extending trade of the large house. Our subscribers in Mexico and Spanish-speaking Californians will find it an advantage.

Several tons of walnuts have been received at many packing houses.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

Alamo Engines

Gas Engines Like automobiles have been greatly improved in the last two or three years. When buying an engine don't buy an antiquated model. Buy an engine that embodies all the latest improvements. THE ALAMO is the modern distillate engine.

SEE OTHERS, BUT DON'T BUY UNTIL YOU'VE SEEN AN ALAMO. DROP US A CARD.

Norton Engine and Power Company

When writing advertisers, mention Cultivator.

Does this stream of water look good to you?
It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs. It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago. How many pump users can say this? It shows conclusively that it pays to install good machinery. We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is six feet long. Has adjustable shoes shown at ends of moldboard to gage depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front and wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveling, Foundation-digging.

For Irrigation, Canal Building Etc.

The price is lower than most such machines. We send it on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century.

The Benefits of Draining Farm Lands

If Properly and Deeply Laid, Tiles Make Possible Greater Crops and Easier Tillage of Soil. An Interesting Letter by a Subscriber

FARM DRAINAGE, as you state in your issue of September 12th, is seldom mentioned in the agricultural press of this State, though it is practiced to quite an extent in our county on the coast. There are two kinds of drainage practiced; the one with open ditches, deep dead furrows, and improperly laid tile, for the sole purpose of carrying off the surplus water in sight; the other, properly laid tile, deep enough and close enough to not only carry off all the surplus water from the area drained, but principally for holding sufficient and available moisture and plant food during the growing season.

To explain the effects of the latter method would take much space and is fully covered in Farmers' Bulletin No. 187, U. S. Department of Agriculture, which should be in every grower's hands, whether his land be wet or dry. So I will confine myself to actual experience.

In regard to the former method I can only give the opinion of those using and preferring it. Our supervisor says that tile are of little or no use. In supposed proof of this he referred to the tiling he had done on the road with doubtful results. It happens that I witnessed the laying of that particular piece and know that the tile were laid by a boy that had never seen a tile laid, and the grade of the ditch had not been established. The tile was left open at the upper end (if the inlet was at that end) and the outlet was closed by a caved in ditch.

A neighbor claims that tiling is not a success and is not as good as deep dead furrows. He has a forty acre field tiled (?) and from looking at the growing crop one can not help but agreeing with him that the poorest growth is directly over the rows of tile. I could not help being convinced of this fact from personal observation much against my will, for my experience has been just the opposite, and I could not understand why his tiling should act so. But I found that it was from faulty construction of ditches.

This neighbor is one of the neatest of farmers and often my place looks decidedly neglected in comparison, but his idea of drainage is to have the tile laid as near the surface as possible and have it below the plow line. The tile is so close to the surface that the soil cannot hold its moisture over or near the tile nor will it be of any benefit to the land adjoining, except by allowing the surplus water on the surface to run off and to give the appearance of being dryer. One thing is certain; that is, his land is being kept up at a great expense of manure by his tenants and the piece farmed by himself or rented by the year. It hardly seems possible that our land here that our best farmers contended could not be maintained without detriment, that after producing abundant crops year after year and a continued washing of soil through deep dead furrows with an annual rainfall of from fifty to sixty inches, in Humboldt county could within the last few years become so sterile.

Tillage proper is undoubtedly one of the most profitable investments that a farmer can make. Seven years ago I put in a line of tile from top and a half feet to five and a half feet deep and after the hay was cut in June and pastured since, you can follow the whole length of the ditch by the heavier growth directly over the tile.

Another neighbor has over twenty-one thousand feet of tile on his forty acres. It is the most thoroughly tiled farm and the most productive. His first tiling caused rank growths to stripe his place, then he put rows of tile between following the lay of the land, and now his whole place is one rank growth of whatever crop he chooses to plant, and says that he has room for more tile yet. He cut five tons of clover and grass hay to the acre and has had abundance of pasture since.

Does grass grown on well-tiled land where the growth is heavy make as good food as that produced on light and less productive soil? The best answer is, that his cows without any other food than this pasture gave returns for the month

of August for over thirteen dollars per head for milk sold to the creamery; for July over twelve dollars and with the price of butter advancing, there is no reason to doubt that they have not reached their highest mark yet. This pasture is still green and growing without irrigation, but from the moisture conserved through the medium of the tile.

There is nothing very difficult about laying tile, but like many other things, you must hew to the line. With a careful eye, good tools and thorough confidence in your level, there is no need of making a poor ditch, but you must remember that a thousand tile will carry no more water than will run through any one of them and any carelessness in placing one tile will seriously interfere with the whole drain.—A. Subscriber.

Why Tiling Benefits the Soil

A. G. McCall, Professor of Agronomy of Ohio Agricultural College, gives excellent reasons for advantage which is derived from drainage. From his report we quote:

Artificial drainage is used to carry the water away more rapidly. The first and the easiest to provide is a system of surface drains which carry away little more than surface water.

If the under or sub-soil is sandy or gravelly, the surplus water readily finds its way down through the soil, but if the soil is heavy clay to a considerable depth it is necessary to use deep open ditches or tile drains in order to remove the excess of water after every heavy rain.

About one-third of the total air space in sand and about one-half of that space in clay is occupied by the soil particles themselves and the other half is taken up by air, if the soil be dry. For the best growth of crops about half of the space not occupied by soil should be equally divided between air and water. If the soil is not drained this space becomes entirely filled with water and the plants whose roots are feeding in the soil are suffocated from the lack of air and oxygen. Some plants, such as the cypress and water lily, have special structures which enable them to obtain their oxygen from the air and water while their roots are entirely under water; but our common field plants do not have this power. Soils that are quite sandy or gravelly may allow the water to pass downward too rapidly and thus deprive the plants of needed moisture. In such cases it is necessary to treat the land in such a way that its water-holding capacity is increased. This may be done by plowing under stable manure or any well rotted vegetable matter which assists the soil to hold water like a sponge.

In the heavy soils the water passes downward so slowly that plants in their early growth send out only a very shallow root system because the free water. In time the water makes its way for common field plants will not send their roots into free water. In time the water makes its way far below the roots of the plant; a drought comes on and the plant dies or shrivels because the root system in its early life did not extend deep enough that it might find film water—that is, a

thin water coating on the soil grains—which would supply it during the dry season.

A tile drain will carry off the free water rapidly and permit plants to root deep. The removal of free water permits air to enter the soil to furnish nitrogen to the clover root bacteria and oxygen to the rootlets of the plant. If oxygen can freely enter the soil, decay of soil particles is more rapid and complete. With the greater quantity of film moisture there is also an increased supply plant food, for it is in this thin film that the tiny root hairs find their food.

Improve Texture.

Under drains improve the texture of the soil. By texture is meant its coarseness or fineness. Wet soils are sticky and if stirred become very lumpy and cloddy. Well drained soils break up more readily and are more easily cultivated. In soils that are well pulverized the root hairs touch more soil particles and can secure more plant food. The well fined soil permits warm showers to enter more rapidly.

A system of under drains assist to keep the soil warm. If one were to take two thermometers and insert the bulb of one in a vessel of dry sand and the other in a vessel of water and allow the sun to shine upon both sand and water until each become 4 degrees warmer, it will be observed that it takes many times longer for the water to show the same rise in temperature. The sun must spend much of its heat on the free water before the soil is warmed very much. If the free water were taken away by drains the sun could spend more of its force in warming the soil. A system of well placed under drains permits the soil to be worked earlier in the spring and later in the fall, thus lengthening the growing season.

If in leveling the ditch the bottom is left irregular, the tile lying lowest will partly fill with sediment unless there is much fall. Great care should be exercised in laying the tile where there is little fall. Drains coming into the main line should join at an acute or very sharp angle. The mouth of drain should be well protected by a screen or coarse wire to prevent rabbits and other small animals from entering. The outlet tile should be the hardest that can be selected, to prevent injury from freezing.

Deciduous Fruit Culture

FERTILIZERS.

RECENT TESTS made at the Wisconsin station show that acid soils require phosphates. It is possible to tell by the use of litmus paper if the soil needs the phosphate in the immediate future. Acids turns litmus paper red and alkalies turn it blue. It is not probable that this test will work in California as nearly all of our land has a trace of alkali in it.

It is shown that the difference in the amount of nitrogen contained in virgin soils and that in cropped soils, is not accounted for in the crops taken from the latter. This would indicate that denitrification is more active in cultivated soils than in those which are not cultivated. This is an argument in favor of green manuring crops in our groves, because such crops help to keep up the supply of humus. It was found that the loss of nitrogen was greater when manure with considerable litter was used than when manure without such material was used. It was found that the loss was greater when nitrate of soda was used than when calcium nitrate was used. The coarse material in the manure containing litter aerated the soil so excessively that the denitrifying bacteria was more active.

Tests with different kinds of manure showed that the largest crops were produced with the application of sheep manure. The order of efficiency of manure ran as follows: Sheep manure, cow manure, horse manure, cow manure with litter and horse manure with litter. The theory is that the carbohydrates which serve as food for the denitrifying germs, is more thoroughly digested by sheep than any other animals. These experiments were made with fresh manures. Where composting is done before the application is made, results are much better with the coarser manures. Green manuring crops showed a minimum amount of loss of nitrogen and the decomposed material was much more quickly converted into humus.

Decomposition.

An interesting experiment was made in which practice and theory confirm each other. Scientists have determined that a certain form of bacteria cause decomposition of vegetable matter and reversion of certain minerals in the soil. They find that different kinds of soil contain them in different amounts. Black marsh land contains the greatest number; clay, sandy loam and sand following in the order named. It is found that decomposition of vegetable matter and fertilizers is most rapid in the black marsh land and the least so in sand. Clay stands next to black marsh land and sandy loam next to sand. The progress in decomposition fluctuates with the amount of bacteria contained in the soil. This argues well for the continuation of planting green fertilizers, as the continual incorporation of vegetation and its decomposition in the soil brings the soil nearer to the condition of the black soil.—J. W. Mills.

The Nut Weevils, by Dr. F. H. Chittenden of the United States Bureau of Entomology, is a reprint from the 1904 Year Book of the Department of Agriculture, and should be in the hands of all nut growers.

TO MAKE CIDER VINEGAR.

Take sound barrels, or any suitable ware or glass—never iron, copper, or tin. Clean thoroughly and scald. Fill not more than half full with the cider stock, which should have fermented at least one month. To this add one-fourth its volume of old vinegar. This is a very necessary part of the process, since the vinegar restrains the growth of the chance ferments which abound in the air, and at the same time it favors the true acetic acid ferment. Next add to the liquid a little "mother vinegar." If this latter is not at hand, a fairly pure culture may be made by exposing in a shallow, uncovered crock or wooden pail a mixture of one-half old vinegar and one-half hard cider. The room where this is exposed should have a temperature of about 80 degrees F. In three or four days the surface should become covered with a gelatinous pellicle, or cap. This is the "mother vinegar." A little of this carefully removed with a wooden spoon or stick, should be laid gently upon the surface of the cider prepared as above prescribed. Do not stir it in. The vinegar ferment grows only at the surface. In three days the cap should have spread entirely over the fermenting cider. Do not break this cap thereafter so long as the fermentation continues. If the temperature is right the fermentation should be complete in from four to six weeks. The vinegar should then be drawn off, strained through thick white flannel and corked or bunged tightly, and kept in a cool place until wanted for consumption.

If the vinegar remains turbid after ten days, stir into a barrel one pint of a solution of one-half pound of isinglass in one quart of water. As soon as settled rack off and store in tight vessels. Usually, no fining of vinegar is needed. No pure cider vinegar will keep long in vessels exposed to the air at a temperature above 60 degrees F. "Vinegar eels" are sometimes troublesome in vinegar barrels. To remove these, heat the vinegar scalding hot, but do not boil. When cool, strain through clean flannel, and the "eels" will be removed.

PROFITABLE GRAPES.

We note in the Dunbar Tribune this:

"The first green grapes shipped from the State this season went from the Alta district and were shipped by Ed. Thompson. Mr. Thompson shipped several cars and on Thursday morning received the returns from the first car he sent out, which was on the 5th of August. This fruit was sold in the city of Chicago for \$2275 for the carload. This means a little over \$3 per crate of 25 pounds, which is rather a handsome price for grapes, or it seems that way to those of us living in the grape-growing section of the State.

"After paying the expenses of packing and the railroad charges Mr. Thompson realized \$2000 from his first car."

Mr. Thompson tells the Cultivator that his ten and one-half acres of Malagas netted this year \$5488.38. It has been a most profitable crop, indeed.

But one point in the clipping from the paper we feel must be incorrect, and that is, that Alta district shipped the first grapes out of the State this season, for we think the Imperial valley must have won that honor by nearly a month. At least, Imperial valley was shipping cars by the middle of July, and the Cultivator of June 27 this year, chronicled "First Muscats were shipped from Imperial last week."

WALNUT GROWING IN THE NORTH

THE question of how far north the walnut can be profitably grown has not yet been definitely settled, but from the northern plantings now being made promises to be shortly solved. Oregon and Washington are both going into walnut planting on a somewhat large scale and these plantings are covering a wide area. In Oregon, it has long been known that there was a very large amount of land suitable to walnut culture and we have seen trees in this state that have been in continuous bearing for fifteen years, and were assured that there had never been a failure. In this section the Franquette is the favorite, and it is claimed for it that it is a rapid grower and a late bloomer and better suited to the North Pacific conditions than most other walnuts, at least any which have so far had a fair trial. The walnut also does well in Northern California, and one of the largest and most profitable orchards in the State is the Vrooman orchard near Santa Rosa. Very much attention has been given to the walnut in Sonoma county and there have been heavy plantings of young trees during the past few years. Luther Burbank's advocacy of the walnut for this section has had much to do with making it popular, and there is a promise that Sonoma county may yet make a specialty of this fruit. Certain it is that the walnut has a much wider range on the Pacific Coast than has been believed and, with proper soil conditions, it will probably do well far toward the Canadian line. The prime requirement of the walnut is a deep, well drained, loamy soil. It is a broad and deep rooting tree and needs room for its growth. It should have abundant water either natural or applied, but must not stand in stagnant water. In the matter of climate, it will stand a very low temperature, growing as it does in England and France, where it sometimes has to endure a zero temperature, but it is exceedingly susceptible to extremes, more damage is done to young trees from the hot morning sun striking them, after a cold night, than from the cold itself. In such cases the side exposed to the sun becomes burned and the tree is injured if not killed. In sections where the rule is cold nights and clear, hot mornings the trees should be protected on the sunny side. In sections where a cold, even temperature is the rule, and the sap is not induced to run by the hot days of the winter months, they will take care of themselves.

A WORD OF WARNING

Entering as we now are upon the tree planting season, and with a prospect of very large importations of eastern nursery stock into our State, a word of caution will not be out of place to intending importers and planters. There are several pests and diseases in some of the Eastern States which we have not yet got into California. The introduction of any one of these might cost our orchardists immense sums annually to combat, if, indeed, it did not ruin their industry. To guard against this and to reduce the danger to the lowest limit, a horticultural quarantine law was

passed by the legislature. This provides that all importers of plants or nursery stock into our State shall notify the proper horticultural quarantine officer of the country into which it is brought, of such importation, and the officer is required to inspect it and see that it is clean before it is passed. The law also requires that each shipment into the State shall have plainly marked thereon the name of the grower and the location where grown. This is a law which should be strictly enforced for the protection of each individual grower, and every importer of nursery stock should see to it that the law is complied with. There are large areas in the East infected with peach yellows, rosette, etc., which are exceedingly contagious and as destructive to peaches as the pear blight is to pear trees. We have none of these diseases here yet, and no stock from sections where they exist should be allowed to enter. It is the duty, as well as the interest, of every importer, therefore, to see that this law is complied with.

CLEAN UP FOR INSECT PESTS.

A very large number of our insect pests take refuge beneath dead leaves and rubbish in the orchard and vineyard, others hibernate in roughened bark or neglected crotches of trees, or in any place where they may be liable to pass the winter season undisturbed. These come out in the early spring and get right down to the business of life—that of starting a new crop of their kind. This new crop soon starts many others and so, during the season, until they appear in destructive numbers to the cost of the agriculturist. To prevent this first brood, which is the progenitor of all the others, the orchard and vineyard should be thoroughly cleaned of all fallen leaves as soon as the trees or vines are bare. All refuse fruit should be destroyed, and all debris be burned. This, followed by thorough spraying during the winter, will greatly reduce the quantity of insect foes to be fought next summer. Early spraying with Bordeaux mixture will do much toward checking the spread of shot-hole fungus and peach blight. This work should be done between the present date and the middle of December and the earlier now, the better. Vine hoppers which are such a pest in the raisin sections, can be largely reduced in numbers by thorough cleaning up of the vineyards in the fall and the burning all rubbish with its contained insects.

PROGRESS OF THE WHITE FLY.

Active work has been commenced against the White Fly in the section of Oroville where it has been discovered. As the fly was in the winged stage when it was first reported, it was not advisable to attempt any immediate action, as it would rather have a tendency to spread it to other localities, but the winged form is now over, and the flies are in the pupa or larval state and in situ. It is now intended to defoliate such trees as it appears worst upon, and then submit others to a thorough fumigation with hydrocyanic acid gas. The whole infested area will be thoroughly treated and it is hoped that the fly will again be checked in its new location.—John Isaac.

KEEN KUTTER

Tool Cabinets

Everyone knows that to buy tools for any work, and be sure of satisfaction, all you have to do is to ask for Keen Kutter tools.

To save the trouble of collecting a useful set, and to provide a place for the proper care of fine tools, the Keen Kutter Tool Cabinets have been designed. Small and large assortments, every tool a Keen Kutter, every tool guaranteed.

The only tool cabinets made containing a set of guaranteed tools under one name and trademark. Made in different sizes and range in price from \$8.50 to \$85.00. If not at your dealer's, write us.

SIMMONS HARDWARE COMPANY (Inc.), St. Louis and New York, U.S.A.

Why is Gen-as-co Ready Roofing better than tar, tin, or shingles for your house and barn?

Doesn't leak—won't crack and crumble, won't rust or rot. No way for water to get in.

Gen-as-co keeps its elasticity and life through years of all kinds of weather. Made of Trinidad Lake Asphalt—the natural storm-defier and weather-resister.

You need the roof that will protect your buildings and their contents, without damage or frequent expense and labor.

Apply Gen-as-co Ready Roofing and you put on a roof to stay. Ask any progressive dealer, and be sure you get what you ask for.

Write for Book 35 of reasons why, and samples.

Water Abundant —at Corcoran—

There are between thirty and forty Artesian Wells at Corcoran which furnish enough water to take care of a section of land each. This water is entirely free from alkali when it is exposed to the air and is excellent for cooking or for drinking. The abundance of water in the Corcoran district makes it exceedingly desirable as an agricultural section.

HER CONDITION.

A widow, coy and sweet, was wooed by a bluff old sailor, who thought the world of her. But not trusting himself to make a direct proposal of marriage, he decided to speak to her in the metaphor of the sea.

"Kate," he said, "your boat is drifting down the sea of life, with no strong hand to steer it safely past the rocks. May I be your captain and sail it for you?"

"No, Jack," she answered with an engaging blush, "but you may be my second mate if you like"—Cotton Seed.

Live Stock and Dairy

CHEESE MAKING.

(Continued.)

WHEN the curd is perfectly formed and springs under the touch, take the knife and put it straight at one side of the pan to the bottom. Cut straight across every half inch. Then crosscut in the same way. Take the pan to the range, putting it on to heat with an asbestos mat under it to prevent burning. Heat slowly, stirring gently until thermometer reaches 98 degrees. Then let the fire go down, or, remove the pan to a side table out of draughts. Cover it closely to retain the heat, after thirty minutes examine the curd. Make a small ball in the center of the hand, squeeze it gently together, if it falls apart as soon as released the curd is cooked enough.

Taking Up.

Push the curds to one side and bail out the whey, using a china cup. This is safer for the future cheese flavor than to use the kitchen dippers. The dippers are liable to taste of soup and onions, not to their discredit, but lowly flavors must not taint the savory mellowness of the cheese. Put a large platter on the table, stand the cheese ring on it. Put a square of cheese cloth into the hoops large enough to completely cover the curds. The muslin should be new and must be well scalded and can be put in wet. Roll up your sleeves and freshen the hands and arms with some warm water. Take up the curds by the handful, press gently together and letting the whey drain. Put the curds carefully to the bottom and fill the ring by gently pressing so that there will not be any irregular places on the bottom sides.

Pressing.

When the ring is heaping full, fold the ends of the cheese cloth over the curds and put on the follower inside the ring. A simple lever can easily be made to press the cheeses. A six or eight foot scantling will answer the purpose for a cheese this size. Stand the chopping block close to a window, or a strong box will answer; put it on a clean board and several thickness of folded flour sacks. Put the cheese on this; place a board on the top and on this a brick. Put the end of the scantling under the edge of the window sill and lay it across the top of the brick that rest on the cheese. Make a weight of about twenty-five pounds by wiring together wornout plow shares slipping them by a wire loop over the scantling. The pressure on the cheese is regulated by the distance the weight is placed from the end of the lever. At first, the weight is close to the cheese, later at the very end; while the curd is soft, too heavy pressure is injurious to the texture.

Treatment.

After five hours in the press, take out the cheese, remove the cloth and gently wash off the whey with warm water. If this is not done the cheese will be sour tasting; rub the cheese dry, now bind the cheese around the outside with a strip of firm muslin, after having scalded out all the starch. Have the muslin wide enough to fold about an inch on the top and bottom. Draw this bandage firmly and lap about four inches.

See us for Sanitary Milk Bottles. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

Fold the edges down on to the cheese and lay on top and bottom the circle of cloth. Scald the tin rings and cool them, wiping them dry. Slip it over the cheese. Stand the cheese again on fresh flour sack. Slip the weights half way to the end of the lever and leave the cheese twenty-four hours.

Salting.

The brine way I like, as it is simpler and seems to make a cheese that does not crack readily in the curing. Make a brine by boiling water enough to cover the cheese, using all the salt that the water will dissolve. When the brine is cool put the cheese into it, cover the top of the cheese with the cloth and wipe it well. Dry salting is done by rubbing with fine salt thickly. Turn the cheese after twelve hours and salt the other side. After twenty-four hours the cheese with salt twice a day for six days keeping it covered with a cloth between time. Either way will make the cheese salty enough to be palatable. When the salting is completed the curing begins.

Curing.

Brush and wipe the cheese smooth from salt and lightly run over it with melted butter. Put on a clean bandage and fresh end covers. It will not pay in cheese making to wash out and use again on the cheese the old covers as they are weakened by using. Turn the cheese daily, and twice a week examine to see if it is cracking. When cracks appear take off the cover bandages and grease again, then if the cracks are deep, use fresh made flour paste and put a paper patch across the openings to exclude the air. Put on fresh bandage and the trouble will probably be at an end. The curing room should be an airy, dry place where the temperature is about 60 degrees. The cheese is ready to be cut in six weeks, or it may be wrapped in several thicknesses of brown paper and then in a tin box to keep away mice until used up.

Warning.

Heat is the enemy of the cheese in curing; it is, therefore, better to have a temperature below sixty than to have it above it for a period.

The pressing is simple enough if it is remembered; lightly at first and increasing as the green cheese grows firmer until it reaches the maximum.

The bandages on the cheese can be greased every other day if the cheese starts to crack badly.

Cold draughts often give trouble in making the cheese dry irregularly.

If it is preferred, the salting can be done in the curds after they are drained and before placing them in the rings or hoops. Use four ounces of salt to every ten pounds of cheese.

An error is made by stirring the uncooked curd too much. This causes the cream to escape in the whey and makes the cheese poor and tough.

In making cheese as in making butter, it is wash! wash! wash! be clean! and then after everything is clean make it clean all over again for safety. It reminds me of the small boy who had a stepmother. A prying neighbor asked him if he was happy. Jimmy said "yes." Then questioned

Rapid Growth

Pigs grow faster than other farm animals because of great digestive capacity. Yet herein lies a danger as well as an advantage. It is easy because a pig consumes much food to spoil digestion by overfeeding. When you fatten pigs it is well to give Dr. Hess Stock Food in the ration twice a day. Better yet, it is well to begin the use of

DR. HESS STOCK FOOD
A TONIC

as soon as pigs are weaned and continue to the time of marketing. In this way hogs are kept healthy and make rapid growth. Dr. Hess Stock Food corrects digestive troubles, gives appetite for roughage, makes cows give more milk and keeps farm teams in condition.

Formulated by Dr. Hess (M.D., D.V.S.) and endorsed by stockmen and medical writers. *Shown a written guarantee.* Costs but a penny a day for horse, cow or steer.

100 lbs. \$7.00. 25 lb. pail \$2.00.
Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our government recognizes Dr. Hess Stock Food as a medicinal compound and this paper is back of the guarantee. If your dealer cannot supply you, we will.

TOUGH BEEFSTEAK.

A remark was inadvertently overheard the other day in one of Fort Collins' prominent hotels, which was in substance that, while this meat inspection might be all right, the beefsteak was tough as ever. Meat inspection guarantees that every animal shall be healthy, and the meat fit for food; it does not guarantee that all animals killed shall furnish juicy meat.

The question is often asked: "Why do we have so much beeter meat in the East than we do in the West?" The difference is easily explained: In the East the range conditions do not exist; the animals are fed and kept growing every day from their birth. In Colorado, range conditions largely prevail. It is either a feast or a famine; animals thrive on the rich, nutritious grasses of the western ranges during the summer, and in the winter, in most cases, are allowed to shrink. An animal that has once become poor will never make good, juicy beefsteak afterwards, no matter how fat he may be at the time of killing. This is the secret of tender beef and the reason why we do not get good meat in this western country, where the live stock business is one of the cardinal industries.

This complaint about tough beefsteak is as old as civilization in the West. It is bound to continue more or less until farmers learn that there is more money in baby beef, and in keeping the calves growing every day from the time they are born until they are a year and a half old, and then selling them for the market. In this way, the producer profits by the growth of the early life of the animal. The profit in feeding an animal gradually increases until the steer is a year and a half old. In fact, there is very little if any money in the small additional growth of the animal after this age. The matter of tough beef is up to the producer, and not to the food inspector.

GEORGE H. GLOVER, D. V. S.

MILKING MACHINES IN USE.

It is said that there are now about 1000 milking machines in use in the United States, among dairy herds. At the Nebraska Station, at Lincoln, one is in use to test in an extensive way the effect of the machine on the monthly and yearly records of cows, as well as the cost of operating. This experiment has now been in operation over a month, and, though considerable data has been obtained, it is difficult to tell just how it will influence the yearly production of the animals. No difficulty has been experienced in milking any and all cows tried, or have any of the animals been forced dry by treatment. Some cows we have wished to dry have been put on the machine, but we have found it necessary to skip milkings in order to reduce their flow. In one case a kicking cow was brought into the herd and the machine proved to be the best milker in this case, as hand milking was extremely difficult.—Exchange.

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

THE DAIRY HERD.

The principal dairy breeds are Holstein, Jersey, Guernsey, Ayrshire and Brown Swiss.

There are several other dairy breeds, such as the French Canadian, Kerry and Dutch Belted, etc., but these are rather scarce at present.

In buying dairy cows, we have a different standard to go by than in selecting beef animals.

A dairy cow is a machine that turns feed into milk and cream. So we must look for one that will convert the greatest quantity of feed into the most milk and cream. The type of dairy cow we want is a cow weighing about 1000 pounds. She must have a lean head and neck. Her eyes should be clear and large, indicating health and temperament. Her body should be narrow over the shoulders and broad at the hips and rump. She should have a large chest, indicating vitality. Her pouch or belly should be large, showing that she is able to consume a large amount of rough feed.

She should have a set of large, branching milk veins leading to a well developed udder, on which are placed four good sized teats.

She should carry very little flesh.

Before introducing any new cows into the stable, have them tuberculin tested to avoid bringing any cows affected with this disease among your healthy herd.

Watch for any discharge that might be due to abortion, as this is another disease you must watch.—Dr. David Roberts, Cattle Specialist, Wisconsin State Veterinarian.

A Florida reader has a heifer that kicks a great deal while being milked. She is quite tame, having been petted since she was a little calf. Such animals never kick unless there is a cause. There may be some derangement of the udder, or there may simply be a tenderness which causes her to object to the manipulation. If the cause is sought out and overcome the trouble can be quickly corrected.

The application of medicines is rarely of any value. The better method is to take a breast strap from the work harness and buckle the hind legs of the animal together by placing the strap just above the hock joints. Then tie the cow gently and manipulate the udder till the milk is drawn. After one or two attempts to kick, the animal will discover that it is useless and will stand quietly. If the tenderness is still present, after a week or so, the application of medicines may be resorted to. Take two drops of turpentine to each teaspoonful of unsalted lard and apply to the udder after each milking. If there is any slight soreness in the quarters, this will remove it. Massage the mixture well into the skin by gently rubbing after the mixture has been applied.

It may be that the udder has been bruised in such way that there are no external indications of the bruise. If care is used in milking for a few weeks, the injury will heal and the animal will cease kicking.—Agricultural Journal.

Continuing to churn after the butter has come spoils the whole batch, at least to such an extent that first-class butter cannot result.

Small waists are coming into style again, which is mighty good news to the short-armed man.

COMFORT OF A COW.

Mrs. M. E. Sherman, the Dairy editor of the Cultivator has written many excellent things along the line of comfort of the cow. To emphasize what she has written the following from Prof. Eof of Kansas Agricultural college is quoted, especially to show how well Mrs. Sherman is supported by other dairy experts. Prof. Eof says:

"Whatever adds to the comfort of the dairy cow increases the yield of the milk. Comfortable shelter and dry bedding and comfortable methods of fastening add to the milk yield. Frequency of feed and water, twice or three times a day, is largely a matter of habit, but regularity of feed is essential to secure the greatest yield. If feeding twice daily is the method adopted the cows should be fed the same hour every morning and at the same time selected for evening feeding every evening. The same rule holds good if the cows are given mid-day feeds. Regularity is very essential for if the cows have to wait half an hour for their feed after the usual time it will cause them to fret and cut down the milk yield."

LOSSES FROM TICK FEVER.

An item in the American Cultivator says that the Department of Agriculture has estimated that the loss from Texas fever, caused by the cattle ticks, amounted to from \$40,000,000 to \$100,000,000 within the last year. This is a wide margin, but taking the lowest figures it is a vast sum to be lost when the remedy is within reach of the cattle men. If all the owners of cattle would unite the plague might be stopped in a single year. It is no wonder that so many range cattle in this State are poor when you see how many ticks each one has to feed. Why not use a few barrels of crude oil and put an end to this drain on the vitality of the stock?

WATER THE COW.

The cow that is stinted on water these days will show a marked decline in milk product. Give the cow water three times a day and be sure to have shade provided. If no trees are at hand provide it from hay thrown on poles set in the ground. The cow must have shade and water or she will cease to supply milk in usual quantity. The milk will not keep so well either, for it is unnaturally heated in the veins and udder and sours quickly when exposed to air.

Every farmer should have from three to five good brood sows and one or two of these at least should be pure bred. Now it does not cost any more to buy a bred gilt, safe in farrow, than it does to buy a full blood boar. And if you are contemplating the purchase of a boar next year, we would suggest that you buy a bred sow now and raise your own boar. A good sow can be bought from \$20 to \$40, and if she has good care should raise 7 or 8 pigs this next summer. Sell two or three of the pigs for money enough to pay for the sow and what feed she and the pigs have consumed and you will have the sow and three or four pigs left for your trouble. Do it now, and get a start on the right road to successful swine raising.

Sorghum is especially valuable as a pasture for sheep and hogs. Cattle should be gradually accustomed to it as pasture. It makes an excellent summer and autumn feed for dairy stock.

Live Harness

Don't allow your harness to dry up and die. Once this happens it can never be remedied. Save the harness, save expense, prevent accidents by using

Lost Strayed or Stolen—One Cow

That is about what happens each year for the man who owns five cows and does not use a Tubular cream separator. He loses in cream more than the price of a good cow. The more cows he owns the greater the loss. This is a fact on which Agricultural Colleges, Dairy Experts and the best Dairy men all agree, and so do you if you use a Tubular. If not, it's high time you

did. You can't afford to lose the price of one or more cows each year—there's no reason why you should. Get a Tubular and get more and better cream out of the milk; save time and labor and have warm sweet skimmed milk for the calves. Don't buy some cheap rattle-trap thing called a separator; that won't do any good. You need a real skimmer that does perfect work; skins clean, thick or thin, hot or cold; runs easy; simple in construction; easily understood. That's the Tubular and there is but one Tubular, the Sharples Tubular. Don't you want our little book "Business Dairyman," and our Catalog A, 25¢ both free? A postal will bring them.

With the Citrus Growers

A BIT OF CITRUS HISTORY.

CITRUS CULTURE in California, like so many other lines of fruit growing, took its inception with the advent of the early Missions something like a century ago. In its beginning it was sporadic in character—the few trees of oranges and lemons (more especially limes in the earlier period) that dotted the landscape over widely separated points, usually found an abiding place within the shadow of the Mission Churches or their immediate environs. For the most part they were planted to supply local wants, no attention whatever being given to their culture as an article of commerce. In extent and variety they were limited, consisting chiefly of the seedling orange and the Mexican lime. This variety in kinds and sorts was universal—it was as pronounced in the sheltered portions of Northern California, in the great thermal belt of the San Joaquin and Sacramento valleys, as in Southern California. In so far as progress and development was concerned, there was none from the time of the advent of the early missions and the period of American occupation. Even after that period the advance was slow and purely local in character, representing small plantings of trees in gardens and limited orchards calculated to meet a local demand for fresh fruit. Some efforts were, however, a feature of the late sixties and early seventies, when oranges began to find their way to ocean vessels to San Francisco and other northern points, chiefly from Los Angeles county. These early shipments were usually sent out in bulk, sometimes in barrels, sometimes in sacks and at other times in boxes. In the northern markets these brought good prices, which greatly advanced the interest in citrus culture and stimulated planting to a little. The first great impetus to citrus growing, however, took its inception when the railroads were completed and made it feasible to ship direct to the Eastern markets.

began in '70.

Citrus culture as a great force in California's horticultural development, takes its date from about 1870. The year previous to that time, Riverside had already taken the initial steps toward becoming a great orange-growing section—a distinction which has been augmented with the years until it is recognized the center of the industry in the United States. At about the same time many other places were exploiting orange planting. Growing settlements with citrus culture as a basic industry were springing up all over Southern California, but chiefly in the San Gabriel valley. For the most part, these early plantings, when coming into bearing, paid handsome returns. In not a few cases as high as \$2000 was realized from a single acre, and from \$500 to \$1500 was not unusual. Naturally an industry yielding returns like this attracted men and money from all sections, with the result that land values increased rapidly and the new acreage being constantly planted, resulted in a development the like of which has probably no parallel in the annals of horticulture. A few figures in the rough will tell forcibly the giant strides made in 1890-'91, when Los Angeles county shipped 112 cars and San Bernardino county 12 cars including what is now Riverside county) 1708 cars; 1898-'99 when the total cars shipped from Southern California aggregated 15,000 valued at about \$12,000,000. Since that period the advance has been healthy, though it is quite so pronounced. At the present writing the total shipments from the south of the Tehachepi range of mountains will average between 25,000 and 30,000 carloads, valued at about \$19,000,000.

Both North and South.

While this development was going on in the southern counties, the American spirit of enterprise was not idle in other sections of the State. In the thermal belt of the San Joaquin valley from the southern portion of Tulare county along the base of the Sierra Nevada mountains, there is a vast area of country adapted to the orange and the lemon. Experimental plantings here and there gave early evidence of climate and soil conditions favorable to citrus culture. Notably true was this of the section of which the town of Lindsay is now the citrus fruit center. As a business proposition, oranges and lemons began to be planted in that locality about fifteen years ago, though experimentally, and in a small desultory way citrus fruits were known in that neighborhood as early as 1862-'63. Last year (1906-07) the shipments from Central California aggregated something like 2000 carloads. For the most part the fruit ripens earlier than in Southern California, thus insuring an independent market which in no way conflicts with the industry as between one section and another. At present there are about 4500 acres in bearing and fully 11,000 acres, both young and old, planted out. The quality of the fruit is in every way superb, clearly indicating that California's sunshine, soil and climate are quite as good in one section as in another. The natural supply of water in that region is ample and warrants prediction that at no distant date orange shipments will be pronounced from that section as raisins are from Fresno.

Besides these citrus growing empires within the borders of the State, there is also what is known in the trade as the Northern Citrus Belt. For the most part this is somewhat broken up or scattered over several counties, including Placer, Sacramento, Butte, Yuba, Stanislaus, Merced, Sonoma, etc. At particular points in all of the above northern and central counties, there are protected areas free from biting frosts in which citrus fruits find congenial conditions. Thus it will be seen that the orange and lemon, though rated as tropical fruits, yet find a wide geographical distribution in a State which is nothing if not a world unto itself for the growing of almost every fruit of the temperate and tropic zones.

In this development of an industry so great and profitable as the growing of oranges and lemons, there has necessarily been much to learn, not only as to methods and management of orchards, as well as conditions and environments, but also as to varieties, methods of picking, packing, shipping and marketing. The present generation of growers owe a debt to the pioneers of the industry that can never be wholly wiped out. How many varieties have been discarded! How many "systems" of pruning, irrigating, cultivating are now only the lore of books! How many disappointed hopes and ambitions have been blasted by ne'er-do-well orchards planted in uncongenial situations! What feasts of reason and unreason, what flows of soul and other things have we not heard at meetings of orange growers during the period of development! How many citrus fairs once captivated the public and centered the best thought, practice and product of the growing industry. What learned discussions both oral and printed, the insect enemies of the tree and fruit have called forth! All these things, elements and conditions about which even the most advanced in the industry were more or less in doubt, have all been satisfactorily solved. It is quite safe to say that the people who make the orange and lemon orchard pay, do so because they possess the "Know How." Take the one question of profitable varieties how the law of evolution has simmered the question down to a very few sorts. "The survival of the fittest" was never more forcibly illustrated than in the supremacy of the California orange and lemon.—R. M. Teague, in his "Citrus Fruits."

The Average Man

has found it easier to make money than to take care of it.

To make money in a line of business with which one is thoroughly familiar is a different proposition from the investment of money after it is earned.

The banker of long experience is the man who knows how to invest money.

Safety of principal and interest and the assurance that they will be paid when due is first in importance. The rate of interest to be paid is of secondary importance.

A-1 mortgages now pay six per cent.

The officers of the JOHN M. C. MARBLE COMPANY have spent their lives in the banking business. Their success has been due to their judgment in selecting investments.

Call and see the bonds and first mortgages they offer.

The Superlative Raspberry

Too much cannot be said in favor of the Superlative. It is a red, sweet berry three times as large as any other Raspberry, to my knowledge. It is a continuous cropper from May to November. I counted on one cane 472 berries of different sizes. Just think of a sweet raspberry as large as a Red Logan. Do you know what that means? It means for years to come heavy demand for fruit and plants. Every nurseryman will want a heavy supply. I received 5,000 plants from the introducer in Europe last Spring, and another 5,000 will arrive in November. I offer 2-year-old Plants now at 50c each, \$5.00 per 12, express paid. Going fast.

The Vegetable Gardener

A FINE LITTLE RANCH.

IT WAS the pleasure of the writer to visit the gardens of the San Gabriel Garden Co., a mile and a half south of the old San Gabriel mission near Los Angeles, a few days ago. The principal crop raised on the place is that of strawberries, which have proved exceedingly profitable even during the past season. This profitability has been brought about by two prime factors: First, growing large quantities of fine quality; next, so packing as to command highest prices.

As to the quantity and quality we trust Mr. Lobingier will soon give explicit instructions for producing the equal, in this department. For the present we may say, that it comes from first securing fine plants; and next, thorough preparation of soil, which means the application of tons of stable manure and plowing in before the planting is done; followed by the finest tilth. Then after the planting, thorough care gives berries which command above quoted prices.

This extra price is not only because of the quality, but the attractive pack; attractive as not only to facing, but all the way through the box. The berries are graded into three grades: The first two vary but little as to size, but the best grade have long stems and only the highest colored and fairest berries. The long stems makes them attractive to the best hotel and exclusive trade. The second grade still commands above the quotations and are exceedingly fine fruit.

Both these grades are given additional prominence by a small band of white paper on which the name of firm and grade of the fruit is printed. This brand has doubtless added much to the income of the ranch. The smaller berries of the third grade are nicely faced and are still a most attractive pack.

Strawberries are not all the production of the place for amongst these are cucumbers which have added not a little to the income this year. We have never seen the culture of the cucumber carried on as Mr. Lobingier does it, and he is now preparing an article for the Cultivator readers, which will be illustrated with photos showing his manner of training the vines.

But the one point now to be made is this, that a little ranch given fine care is far better than a greater body of land with indifferent care. There are but few large ranches which can ever give the proportionate return which Mr. Lobingier's little five acres have done this year.

GROWING ONIONS.

As noted in the queries last week Mr. Lobingier, of the San Gabriel Garden Co., would furnish a few suggestions on onion growing, which will be of value in this, that whatever he writes about he knows from years of experience in the garden.

The best variety to plant depends on what kind of a market the grower has in which to dispose of them. If you think to market them in the early part of the summer you must sow the seed or plant the sets early in the fall. August for this locality (San Gabriel). For this season it is now too late, so that the grower would of

necessity have to plan to sell the crop in the fall. The yellow Globe Danvers is a very valuable variety throughout California. Possibly the best onion for the main crop is Australian Brown—if grown upon soil adapted to it. Good sandy loam that is well enriched will produce fine crops of this variety. It is the best keeper known.

Two methods are in vogue in onion raising. One is to sow the seed in well prepared seed bed and when the plants are large enough transplant into the open field in rows 12 to 15 inches apart and two and one-half inches apart in the rows. The other is to sow the seed in the open field at once.

Both methods have their advocates. For some unexplained reason transplanted onions will grow larger than when grown directly from the seed, and many hold that the labor of transplanting does not equal the cost of weeding and thinning the plants where the seed has been sown in the open field.

Pure ground bone would be a good fertilizer to use, putting it on the ground before planting, at the rate of 1000 pounds per acre. Mix it well in to the soil by going back and forth several times with the cultivator. Where one row only is planted a strip 15 or 20 inches wide would be sufficient on which to spread the bone dust. Sow the seed thinly and evenly, about February first. Be particularly to have the rows straight if you want to make it easy to do the cultivating.

When the plants are three or four inches high thin out so that what is left stands two and one-half to three inches apart in the row, and keep out all weeds. Irrigate as often as needed to keep the ground in moist condition; that is, never allow the ground to get so dry that the plants will suffer for want of moisture.

I want to add a word of caution to the novice about going into the business of onion growing on a large scale, until he has had experience, and particularly about expecting to get the prices next year that were obtained this year.

Some eight thousand acres are devoted to the business in the rich alluvial lands in the Sacramento valley, that met with destruction last year by floods, thus causing a great shortage in the supply. This may not occur again for many years.

The beginner almost always undertakes too much and fails. Begin in a small way until you learn the details of the work.—Q. A. Lobingier.

The executive committee of the American Farmers' Institute Workers have announced that the meeting of the association will be held in Washington, D. C., October 23 to 25, 1907. This meeting promises to be one of the most interesting that the association has yet held, a very complete programme having been arranged.

In the opinion of the Sun, the income of three-quarters of a million a year from lemons alone is only an illustration of what can be done along other lines of horticulture and agriculture. The lemon program for prosperity is not an expensive program. Other crop, including every other annual crops, can be made equally profitable.—San Diego Sun.

The Ornamental Garden

THE IRIS.

IRIS is a genus of bulbous and herbaceous plants native in various parts of Europe, Asia, Africa and America. There is a large number of species, many of which have been cultivated in European gardens for centuries, and from which garden forms that are superior in many ways to the types from which they originated have been raised by intercrossing and selection. The types being so numerous, and the geographical distribution so wide, flowers of some species or varieties of iris may be seen in bloom at almost any season of the year, and under most varying conditions. Some kinds require a warm dry situation, with abundance of light and sunshine, while others are denizens of swamps, and require moist and shaded conditions to bring them to perfection. The flowers of most species are very beautiful, and are extensively used for decoration in Europe, where, in addition to the varieties grown in the flower garden, bulbous kinds are grown in pots and forced into flower prematurely in heated glass houses. Orris root, used in medicine and perfumery, is derived from *Iris florentina*, a species worthy of culture as a garden plant.

Irises are divided into several sections, but for the purpose of these notes it is sufficient to mention the principal groups only. The most generally grown are the Flag irises (*Iris Germanica* and its varieties,) in which are included other types and their hybrids. The chief characteristics of this group are:—The foliage is broad and in most varieties dwarf, rising from a creeping root-stock or rhizome, and the flowers large, generally blue, purple and white in color. They are all hardy and will thrive in almost any situation. Flowers of this section are produced in spring. The Japanese iris (*I. Kamperferi*) is fibrous rooting, and produces tufts of foliage 3 or 4 feet in height when well grown, above which the large distinct flowers are borne during summer. There is a greater range of color in this, than in any other section. It grows to perfection when planted beside water courses and in other damp places, but will also thrive fairly in ordinary borders if the soil is of a loamy nature.

The Spanish and English irises (also known as Xiphions) with other species, including *reticulatum alatum* and *juncum*, are true bulbous plants that produce their flowers during spring and summer. In the so-called English irises, the original types of which are natives of Spain and Portugal, the colors of the flowers are white and purplish shades; while the flowers of the Spanish irises are yellow, bronze, white and lilac in color. The foliage of this class is usually narrow and rounded.

The irises are plants worthy of much more extended culture being in most cases very hardy and easily grown—thriving without artificial watering. They produce beautiful flowers, which are excellent for general decorative purposes, and totally unlike those of any other hardy plant.

Soil—Situation—Culture.

The Flag iris will succeed in almost any kind of soil, that of a loamy nature being most suitable. No manure is required unless the soil is very poor and shallow, when some well rotted

cow or stable manure should be incorporated. Good drainage and sunny positions should be provided. The plants are increased by divisions of the root stock. A piece of the parent plant may be cut off with roots attached, and planted at about the same depth as originally occupied; the bare covering of the creeping shoot—as it really is—being sufficient. The soil should be firmly pressed and afterwards watered as in the case of planting out generally. After culture is mainly cleaning and weeding.

While damp, or even wet situations are suitable, it must not be assumed that they will succeed in sour soil. They will endure abundance of moving water, but not that which is stagnant. Divisions of the fibrous rooting kinds may be planted during autumn or early spring.

The bulbous section should be planted in autumn in well-drained and rather light soil. They are increased from offsets of the bulbs. The bulbs should be planted at a depth of 4 to 6 inches, and about 4 inches apart to allow for multiplication. They are most effective in the garden when planted in large patches, and may be allowed to grow undisturbed for three or four years.

A STORY OF CHINESE LILIES.

Very few people who see and admire the beautiful Chinese lilies know the reason why this particular flower is held in such favor in the Orient. This is the story of the origin as told by a Chinaman:

Years and years ago a member of the celestial empire had two wives whom he loved dearly because each had borne him a son. While they were still lads the father died and in settling up the estate some difficulty was encountered, for the man left his heirs two pieces of land, one a strip lying in a fertile and beautiful valley, the other a small ribbon of land bordering the bed of a narrow stream. The former land was known to grow anything the country produced, while the latter was counted utterly worthless.

It was at first proposed that each of the two strips be divided in half and a section of each be given to the two heirs. But the mothers could not agree upon the division and it was finally arranged that one son should take the rich land, while the other should take the sterile piece.

The valley strip yielded bountiful harvests season after season and the rocky one gave nothing until one day the boy owner happened to notice a tiny white, sweet-scented flower blooming among the rocks and after a careful study and examination it was found to be the only one of its kind in China. The flower grew from a bulb and the boy discovered that these bulbs could be transplanted to similar rock soil without destroying their growth.

Soon the bulbs were in great demand and when it was learned that the flowers brought good luck to the owner of the plant the boy had all he could do to supply the market. From the sale of the bulbs he grew enormously wealthy, while his brother never made more than a good living out of his valuable valley property.

Oxnard walnut warehouses are being filled with the new crop.

JEFFREY APPOINTED.

The appointment of J. W. Jeffrey, State Horticultural Commissioner, to succeed Elwood Cooper, was not unexpected.

Some weeks since Gov. Gillett indicated his determination to appoint Jeffrey before the close of the year and he has done so.

The advantage Mr. Jeffrey had in the contest for the office of Horticultural Commissioner was twofold; first, in age, being a much younger man than Ellwood Cooper, and second, in being a practical horticulturist. His early training on a fruit farm and in the nursery business, and the practical knowledge he obtained while so engaged has been of inestimable value to him in the many years he has been commissioner of Los Angeles county. During these years he has made himself a valuable official by reason of application to his duties and an intelligent knowledge of the needs of horticulture in general.

The office of State Horticultural Commissioner is in fact a big one, for it is the consulting head of all horticultural interests in the State. Unless we are mistaken in judgment, J. W. Jeffrey will prove equal to the needs of the office and reflect credit upon it by intelligent, conscientious application to its duties.

Mr. Cooper, who has been connected with the Department of Horticulture in California, in one position, or another, for 25 years, or more, retires from the office of State Horticultural Com-

missioner with the confidence of the people generally, and had he been a younger man would probably have retained his position. But there has been a feeling throughout the State that a younger man should be appointed, and this opinion we believe has had much to do in influencing the decision of Gov. Gillett.

The State will expect much from Mr. Jeffrey, and we trust and believe he will not disappoint his constituents.

TAXING THE FARMER.

Governor Harris of Ohio, has called a convention of governors to meet at Columbus, some time this month, to consider a proposition for a uniform law throughout the United States, covering taxation of farms and farmers.

Naturally it is an easy matter to assess farm lands, but a difficult one to correctly assess the personal taxes of the farmer on an equitable basis with the city dweller.

For many years assessors have worried with the proposition of how they can reach the personal property of the wealthy who live in the city. So expert are the rich in hiding their personal property that but a small per cent. of it ever reaches the assessor's books.

The farmer, on the contrary, can escape no part of his taxes. His lands are open to notice, his stock can easily be assessed and the only thing he can cover up is his bank account, if he has any. The plan of Governor Harris is to secure a uniform system whereby the farmer may get somewhere near an even deal with his city brother. He has never done so in the past, and we fear he will not be able to do so in the future. However, the suggestion of Governor Harris is worthy of consideration, for out of this conference may be devised a plan whereby something near equity, in taxation between personal and real property, may be arrived at.

It will be interesting to note the result of the Columbus conference at any rate.

BUYING NURSERY STOCK.

If any incident were necessary to emphasize the danger orchardists and floriculturists in California confront in ordinary nursery stock from disease infected points we have it in the White Fly.

This disastrous insect without doubt, was imported into the State from Florida. It may have come on plants sent through the mails, which escaped the eye of the inspection officers, or it may have found lodgment in express packages, no one knows certainly just how it was introduced. But it probably came in on plants or nursery stock which were not inspected.

Had the State Horticultural Commission been in the least degree negligent in enforcing the "clean-up" law, California would have encountered the most serious plague in its history, for the White Fly is the worst insect to destroy citrus trees and certain plants known to exist; it is the most destructive in its aggression. But it now looks as if this enemy is to be routed from our State and that another season will see it entirely destroyed.

The lesson we have been taught is a serious one; we have paid dearly for our lack of care in the loss of thousands of bearing trees. We ought not to need another lesson during the lifetime of the present generation. We ought never to order plants or shrubs, or nursery stock of any kind from foreign growers in infected districts, because we get the worst of it every time.

The different varieties of scale, which infest our orange and lemon orchards, were imported into the State. So was Red Spider. It would seem that we have had experience enough, in ordering nursery supplies from plague infected districts, to last us during our lifetime. But to make certain that we get no further experience we should cut out every shipment from Florida, and from the islands, and order only through State nurserymen who subject their consignments to rigid inspection.

It seems a little unkind to write this, but self preservation demands that we speak plainly.

Florida must eradicate the pests which infest its nurseries or cease to ship outside her borders. Neither foreign countries nor neighboring commonwealths can permit infected stock to be re-

ceived. Hence we say, order nothing from so insect infected countries but only from reliable home dealers who are responsible for what they sell and can be punished if they misrepresent their sales.

Horticultural Commissioners, from this time on, must exercise continual vigilance against importation of all plants from pest infected countries.

HELP US GROW.

There is not a member of our 12,000 subscribers to the Cultivator who could not send a new name before the first of January if he or she, would take occasion to speak to a neighbor of the value of the paper to the farmer, or fruit grower.

Scarcely a mail that does not contain one or more letters of commendation for the valuable information given in its columns from week to week. Some of these letters have appeared from time to time, and pages could be filled with them.

As a business proposition no grower in California can be without the Cultivator. It teaches the elementary principles of farming, fruit and vegetable growing, dairy and stock care and development with a vast amount of general information in regard to the conditions generally included in every issue.

Here is a sample of the letters which come into the office in almost every mail. "The Cultivator is my best friend in agriculture. It is of much value to me I could not be without it even if it cost me twice what I pay for it."

Another, "The Cultivator is invaluable to me. Its poultry pages alone pay for it every month. Under date of Oct. 4, a renewing subscriber says, "Send along the Cultivator; its articles on dairy and live stock are as good as the best I get in papers costing \$2.00 a year."

It has occurred to us that the Cultivator family could double itself in a month, if every subscriber would take the trouble to interview someone who does not now take the paper and get him a subscription. We have quite a number of friends who do this, and we greatly appreciate the service, and if each member of our family would only take a little time, it wouldn't require much time to do it, to present the matter to his neighbor, how quickly we would run our big list to twice its size. Realizing what this assistance would mean, can we be criticised for asking it?

We want to help every grower, and every orchardist, and every dairyman in California and we are endeavoring so to do. We are in this work to help others and we can but feel that we are asking little in return when we make this appeal to our subscribers to stand behind us, and be a part of us, in the great work in which we are engaged.

COVER CROPS.

Mr. Thorpe of Covina is one of the successful orchardists of Southern California. Although a young man he has given much study and practical attention to the subject of cover crops.

In an address before the Farmers' Institute of Pomona, he made some strong points in advocacy of cover crops and their value to citrus orchards. Of the different classes of cover he seems to prefer vetch, although Canadian field peas find favor with him.

When asked as to the time of planting he gave October as a favorable month because the crops should be matured by February. In order to obtain the best results the ground should be thoroughly irrigated; allowed to remain just long enough to work up with a drill, which must be done before the seed is planted. It is well to have the plants strongly rooted before the winter weather cools the ground, for in this case such a start will be obtained that the plants will keep a strong growth and not suffer from being dwarfed.

The value of cover crops is two-fold. First, in the mechanical effects, lightening the soil, and giving needed humus.

Of course, the better the fertilization the better fruit we shall have, and as only the best fruit pays it is to the personal interest of every orange and lemon grower that he use cover crops sufficiently abundant to produce the results desired. The thrifty orchardist will not allow his soil to become infertile for want of humus and the use of cover crops will remedy that defect.

Agricultural Notes of the Pacific Coast

Northern California

California furnishes one quarter of the nation's fruit.

Glenn county will have a thousand acres of rice next year.

Vacaville will produce four thousand tons of prunes this season.

An immense damage has been done by forest fires east of Lincoln.

Sutter county prunes are all on trays and the yield has been good.

Glanders is alarming live stock owners of Fair Oaks near Sacramento.

Vacaville has shipped about six hundred cars of green fruit this season.

The average yield of beets in Yolo county is about sixteen tons per acre.

Many acres will be planted with resistant vines about Santa Rosa this season.

Luther Burbank has an exhibit of pineapple cactus in the Ferry building at San Francisco.

State Horticultural Commission is making a strong fight against the White Fly in Oroville.

A Suisun valley fruit man has been shipping a small quantity of fruit to Manila this season.

Nevada city had a big forest fire last week burning one ranch house and doing much damage.

Thirty-five acres of land on the Tate Farm at Davisville have been graded ready for irrigation.

Tuolumne county has one hundred and twenty square miles of burned over area, as a result of a fire last week.

It is rumored that Mr. Harriman will expend over \$1,000,000 in icing plants to protect California fruit output.

Sheep men near Nevada City have been compelled to drive their sheep from the upper valleys by the falling snow.

A large number of Dunkards are settling about the new town of McDoel in Butte Creek valley nearureka.

The Southern Pacific and Union Pacific will unite in the construction of a large fruit icing plant near Sacramento.

The Headlandsburg Enterprise says that over two hundred acres will be planted to vineyards of that vicinity this season.

A fire destroyed a grape dryer near Woodland recently. It was filled with grapes and made a serious loss of over \$12,000.

A grain buyer of Willows paid 1.35 per hundred for Moravian barley. This is the highest price since pioneer days.

The Pacific Coast Sugar Co. at Hamilton city, claims it will have an output of seven million pounds of sugar this season.

The wool growers of Yuba and Sutter counties met at Marysville October 12th and made final arrangements for the sale of their product.

The Alta Beet Sugar Co. of Butte county, has been handicapped for some time for want of beets, but has now induced a large number of Portuguese to engage in the industry for the coming season.

Central California

Turlock is to have a new winery in the near future.

Tulare county lemon crop is declared to be fine.

Watsonville has shipped over eight hundred cars of apples to date.

The hay producers are clammering for shipping facilities near Turlock.

The bean harvest has turned out remarkably well in San Joaquin valley.

Twelve thousand dollars from twenty-two acres of peaches is one of Visalia's claims.

The exchange packing house at Lemon Cove has been enlarged by a 60x70 addition.

The streams of Monterey county are being stocked with trout from the hatchery at Sisson.

The first hundred cars of Malaga grapes shipped from Fresno netted the grower \$75 per ton.

Fresno bankers are combining and petitioning railroads to give cars for moving of the present raisin crop.

San Benito county shipped a car of apples to London the returns of which were nineteen shillings per box.

Sixty carloads of apples are ready for shipment and piling up in the packing houses at Watsonville for want of cars.

The raisin growers became frightened last week and did a vast amount of stacking of trays, but after all the weather remained fine.

The Italian-Swiss colony of Le Moore has brought suit against several growers of Kings county for non-fulfillment of contract.

The Fresno Chamber of Commerce is after a land boomer who is advertising dry lands as covered with irrigating water.

Fresno papers have given Hanford a hard dig on account of alleged wide openness in selling intoxicating beverages at the Hanford fair.

It will require five thousand cars to ship the hay from Tres Pinos and surrounding country. This means thirty cars a day for eight months.

The County Board of Supervisors of Tulare have agreed to advance \$1000 in aid of the county citrus fair to be held at Lindsay in December.

The State Grange at its meeting at San Jose last week discussed the matter of prohibition of foreigners of holding real estate in this country.

Governor Gillett has appointed J. A. Filcher secretary of the Board of Agriculture, as commissioner from California to the Alaska-Yukon exposition to be held in Seattle, 1909.

Watsonville has just shipped a carload entirely made up of three tier apples of such quality as to make Easterners sit up and take notice that California is some on apples.

Italian vegetable men of San Francisco have evolved a raw swindle by putting a section of well casing in the center of a sack of potatoes, and packing fine, large spuds around it, which after being filled with small potatoes or even dirt and rubbish is withdrawn leaving a facing all around of fine potatoes and the center absolutely worthless.

Southern California

Eighty pounds of sweet potatoes in one hill is the record at Imperial.

The first rain storm of the season was general over Southern California last week.

Orange men are pleased with the prospect of plenty of cars for next season's output.

Imperial valley dairymen are holding meetings looking toward securing help for their dairies.

The annual picnic of the Claremont Pomological Club was held at Ganesha Park, Pomona, last week.

The Brawley News says the corn crop of that section will show Imperial valley superior even to Illinois.

The Board of Supervisors of Orange county have elected W. S. McFarland of Anaheim, county veterinarian.

The wind of the latter part of last week did some damage to young oranges, but it is still thought the crop will be much in excess of last year.

"Within seventy days" is the promise of the constructors of the canal and flume which will give water to District No. 8, Imperial valley.

Two cars of oranges have been shipped this season from Redlands in a new pulp board box, which is said to be the equal of the lumber box.

Santiago Orange Growers' Association of Santa Ana received for the fruit of the year, \$185,456, of which there is distributed to the growers, \$145,180.

Fumigation is on in full force in San Bernardino county. Six county outfits are at work steadily. Besides this several contract outfits are doing some work.

The California Fruit Growers' Exchange is discussing the question of acquiring timber land and erecting mills for the manufacture of boxes for its members.

The late storm winds have been disastrous to the apple crop in Yucaipa valley. In some instances it has been reported that about one-third of the apples were blown off the trees. On other orchards the damage is nominal.

Southern California rural papers seem to be an easy mark for the shrewd soap advertiser who has secured a vast amount of free advertising because of the "marvelous" remedy supposed to be contained in a certain kind of soap.

The hope that wild turkeys might be imported from Arizona and placed on the forest reserves of this State is said to be blasted by the statutes of Arizona which prevents the shipping live turkeys from that territory. A new scheme is now on foot by which turkeys can be introduced from Mexico.

Riverside Heights' Association total shipment of oranges aggregates 278,643 boxes, which received the gross amount of \$490,533. The directors to handle the business for the coming year are: W. P. Russell, J. E. Cutter, Dr. J. G. Baird, L. H. Dr. W. Robblee, J. A. Allen, H. A. Westbrook, G. L. Winterbotham, J. W. Covert, C. W. Waite and H. D. French.

The Coast

Many moldy hops are injuring the reputation of the Oregon products.

A half crop at half price is a very hard blow to Washington hop growers.

The first Monday of October was observed as prune day at La Grande, Oregon.

The shortage of the pack of green corn in Oregon has caused an increase of price.

The grape crop of Lewiston, Idaho, began marketing about the first of this month.

A contract has been made for \$500,000 for an irrigation canal at Twin Falls, Idaho.

The Northern Pacific shortage of cars is proving embarrassing to Northwestern farmers.

Farmers of Colorado are happy over the location of the \$1,000,000 packing plant in Denver.

Linn county is to have a big apple fair on November 7th and 8th to be held in Albany, Oregon.

Nearly three hundred thousand American farmers have moved to Western Canada this year.

Marion county, Washington, will market two hundred and fifty carloads of prunes this season.

Every dairy and creamery near Spokane is working to its fullest capacity to supply the local demand.

A single orchard of two hundred acres of Royal Ann cherries is to be planted this fall at Eugene, Oregon.

At the disposal of a large body of land in Idaho which was by lot, \$10,000 was offered for the option of first choice.

Wild oats are proving a serious pest near Plaza, Oregon. The worst feature being that they sap the ground of all moisture.

Apples of which there are a great number raised near Pullman, Oregon, are said to be remarkably free from codling moth this season.

There is a strong competition between Colorado and Oregon potato growers which is causing an easier price than prevailed earlier in the season.

Investigation is to be carried on at Fort Collins, Colorado, in the manufacture of paper from beet pulp, the refuse from the manufacture of beet sugar.

At midnight of September 30th a reservation of government land was thrown open near Bend, Oregon, and the land was soon located upon. There were about three settlers for each 160-acre tract.

One milling company at Waitsburg, Washington, has one hundred thousand bushels of wheat piled outside its warehouse, and all day long ten mule teams are hauling additions to the big pile.

Inspectors of fruit in Washington, especially at Tacoma, have caused destruction of Oregon fruit, because of San Jose scale which has caused rather strained relations between those two sections.

The largest apple orchard in Island county, Washington, is eighty-five acres of about thirteen thousand trees most of which was planted years ago and proving remarkably profitable this season.

Buy the World's Famous Egg Food No. 4

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledge standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co., Indiana and Yolo Sts., San Francisco, Cal.

Also Pioneer Manufacturers of High Grade Fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

When writing advertisers, mention Cultivator.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

POULTRY MEETING.

THE Los Angeles County Association held its regular monthly meeting Oct. 8 in Assembly Hall, Chamber of Commerce building. An interesting program well advertised brought out the largest crowd of the season.

The first number was an interesting talk by Mrs. Basley, editor of the Live Stock Tribune, on failures. She told us why so many make failures in the poultry business.

One of the reasons given was "the man, or woman, behind the feed bucket." We agree with her in this for we believe many failures can be traced to carelessness and indifference and lack of judgment in feeding than any other one thing.

John D. Mercer gave a talk on "his hobby" the Cornish Indian, and Mr. McLaughlin told us why the Wyandotte is the best bird.

Mrs. Hubbard, Mr. Schofield and Mr. Humphreys gave excellent talks. Mrs. Hubbard's paper:

"How I Hatch in Adobe Incubator."

I will first relate how I care for the eggs previous to incubating; also how the buildings are built.

The egg-house is built of adobe with walls ten inches thick. The roof has four-inch dead air space. There are two ventilators, one in the roof and one through the wall near the floor. Two windows with muslin tacked over and double doors. The egg shelves are two and one-half feet deep with a strip about two inches wide nailed in front. I use bran on the shelves, spread about one inch thick, and place the eggs in rows with the large end, or the end which has the air space, up at an angle of about fifty degrees. I turn the eggs from one side to the other with a little side turn at the same time once a day until I set them. If it is dry weather I sprinkle the floor and hang a wet sponge in the egg house.

Last November and December I kept eggs in this way for six weeks waiting to get hens. I set the eggs and hatched 50 per cent. The temperature in the egg house staid close to 55 degrees.

The incubator is a double building, the inner one being circular and 11 feet in diameter, the outer one square; there is a double roof with four-inch air space and two to three-foot air space between the walls. There is a ventilator in the center of the roof. The furnace is in one corner to the right of the double doors, and is so arranged that the fresh air enters from out of doors through a pipe into an air chamber over the oven. There it is heated and enters the incubator through a four-inch pipe and is distributed near the ceiling. The shelf on which the eggs are hatched is about three and one-half feet high, is covered with a layer of adobe; another shelf about one foot below and a third shelf made of boards laid across cleats on the ground below the second shelf. About one inch of bran is spread on the shelf before setting the incubator. It holds 3000 eggs.

I have the temperature at 103 degrees when I put the eggs in. I keep the temperature at 101 to 102½ the

first three days, then at 102, 102½, 103. I do not let the temperature above 103 if possible. Eggs under old hen do not go above 103, and will find that the eggs under hen's wings are not as warm as under the body. She turns them often in the night, as well as in the day and the eggs are not always at the same temperature. I turn the eggs twice a day and give them the same turn as in the egg house and change them about. I keep ten thermometers and one Hygrometer. The latter I keep at 80 to 85 degrees. The thermometers are placed on the eggs. I was by so doing that I found the temperature was less on a dead or cold egg; also, that at hatching time the eggs in which the chicks were about to pip would get very feverish as the temperature would run up as high as 107. On the other hand, a pipper egg five or six eggs away, the temperature would be only 103. I set the eggs at three days and again at seven days on the 19th day. I test all the eggs so as to place the lower end of the air space up and discontinue the regular turning the remainder of the hatch. Twice a day I place my hand on the eggs and, pushing them gently from one side to the other, stop where I began, so as to leave them in the same position. I do not depend entirely upon the Hygrometer for determining the moisture, as I can tell by the air space when the egg needs moisture. I provide moisture either by hand or with a small hand spray pump, the latter preferred. I even provide moisture to the eggs set under the hens at times. When chicks are two to three hours old, place them in a basket and set them on a shelf below the hatching shelf which is a few degrees cooler. After the chicks are about 12 hours old place the baskets upon the third shelf and keep the chicks in the incubator about 36 hours before taking to brooder.—Mrs. C. D. Hubbard.

Mr. Humphreys' Address.

Mr. Wm. M. Humphreys, ex-president of the County Association, made one of the interesting addresses of the evening. His subject, preparing birds for the show, is one of vital interest to all breeders of fancy poultry, and was truly appreciated by the present.

Mr. Humphreys has made a success of the poultry business in this State and his remarks will be interesting to all readers of the Cultivator.

He believes that we Californians are not getting enough for our birds although we have a reputation for high prices on poultry, and says that if the poultry breeders would establish a price and stick to it, they could command a price which would enable them to make a fair profit on the birds.

In speaking of preparing birds for the show, Mr. Humphreys said: "When a man begins to think about getting his birds ready for the poultry show, the first thing he does is to take out his poultry magazine, usually an Eastern publication, and looks it through for advertisements on breeding stock; and the man who can tell the biggest story is the man that gets the order. I have no bird

sell, therefore, I can speak plainly. Usually the Eastern "fancy breeder" has nothing more than an ordinary luckster. He gathers all the poultry for miles around, paying usually about 75 cents per head, and then dresses and cleans them up and sells them to the Western breeder at fancy prices. And, it is all in the advertising. Not long ago a friend mentioned a business proposition to me, and as I am always open to a "sure thing," I, of course, listened to what he had to say. The business involved about \$50,000 cash, ten thousand of which was to be the capital stock and \$40,000 was to be spent in advertising. It seems that the Easterners are good advertisers and good talkers and, therefore, get results. You can get results. So when you get your show birds, don't sent East. It is better to go to some friend, a well-known person in your community, who has established a reputation as a breeder, for your birds.

We may say that you have your flock started. The man who has the largest flock has the best opportunity for selection of birds for the show, although the small breeder has the advantage because he can give his birds more attention. The flocks of small dealers, therefore, respond to show conditions better than those of the large breeder.

Now we are getting down to show time. Some of our people say, when you select your birds for the show, give them straw rooms, cover the yards with straw. Many breeders have found, however, that the birds kept in straw runs, have taken on the mut from the straw. Some believe sandy runs to be better than those with straw; but if the birds are not accustomed to sand, they will naturally scratch more, and if there is any dirt, it puts the birds in a bad condition. In preparing my birds for the show after they are washed, I sweep my yards as clean as possible so that the birds do not get dirty.

Most of the breeders wash their birds in preparing them for the show. Some claim, however, that washing destroys the lustre of the plumage in black birds. At the last poultry show there was as fine an exhibit of black birds as I have ever seen in New York, Boston, Chicago, or any of the large Eastern poultry shows; and it would be interesting and of value to know how the breeders of these black birds prepared them for the show.

Mr. Humphreys then gave his method of washing birds, and also showed a clever invention of his for holding birds during the washing. To those inexperienced in this branch of the business, his description was very helpful.

WHITE WYANDOTTE FARM

The writer recently had the pleasure of a visit to White Wyandotte Farm at Inglewood. This is one of the best equipped poultry farms in the State, and breeds White Wyandottes exclusively.

The new manager, Mr. Robert A. Condee, is doing some hard work getting the place in shipshape for winter. Mr. Condee has been identified with the poultry business for a number of years and not only understands the practical end of it, but is also a true fancier.

Knowing how to mate, condition and prepare birds for exhibition, we feel that he will make a success in his venture as manager of the farm. The owners of White Wyandotte Farm ought to feel proud that they were able to get a manager that has had such a broad knowledge of the business as Mr. Condee.

Poultry Show Dates

San Jose, Cal., Nov. 11-16, 1907.—Annual Exhibition Santa Clara Valley Poultry and Pet Stock Association. Charles R. Harker, secretary, San Jose, Cal.

Oakland, Cal., Dec. 2-8, 1907.—Fourth Annual Exhibition of the Alameda County Poultry Association. C. G. Hinds, secretary, Alameda, Cal.

Los Angeles, Cal., December 5-14, 1907.—The Nineteenth Annual Poultry and Pigeon Show of the Los Angeles County Poultry Association Corporation. Comparison judging W. L. Sly, Hollywood, president; C. D. Hubbard, secretary, San Fernando.

Fresno, Cal., Dec. 11-14, 1907.—Tenth Annual Exhibition Fresno Poultry, Pigeon and Pet Stock Association. George R. Andrews, secretary, Fresno, Cal.

San Diego, Cal., Dec. 17-21, 1907.—Sixth Annual Poultry and Pigeon Show of the San Diego County Poultry Association. George I. Badger, secretary, San Diego, Cal.

Los Angeles, at Chutes Park, Jan. 6-12, 1908.—Second Annual Exhibition Breeders' Association of Southern California. Dr. Winslow, president; H. A. Meserve, secretary. Birds will be received January 1st. Judged by score card and awards read before public is admitted Monday, January 6th.

WHITE CHINA GESE.

These beautiful geese, though not generally known, are a most deserving variety and wherever tried soon become genuine favorites. They certainly combine both beauty and utility. They are often called White Swan geese, having a very long, slender and graceful neck, orange bill and large orange knob on their head, which enables one to easily distinguish the gander from the goose, as his knob is much larger.

They are of fair size, and are now being bred from two to six pounds above standard weight, which is a good idea. The feathers are very abundant, fine and soft, much more so than any other goose feathers; they are soft as duck feathers and much nicer. So there we have one good point as a market bird.

Here is another: If well cared for, they will lay for eight or ten months in the year, and as a rule the market price is three times that of chicken eggs. Then, again, for home use the eggs are just fine.

The young are easily raised, requiring but little care or feed; about all they need is protection at night during storms, and plenty of weeds and grass, with enough water to drink.

As to pets, they are the friendliest to be found. They will soon learn to understand just what you want them to do, are easily confined, as they do not fly, and can, after one or two attempts, be driven anywhere. The crows and hawks have never bothered mine, though they are death on chickens.—Farm Life.

Hen Fruit Pays. If you want more, feed

Egg-More

Poultry need to be fed a scientifically balanced ration as much as any other stock. Egg-More is just the thing to mix with good grains to make the same a rightly balanced ration. It is highly nitrogenous, very rich in protein, will keep the hen in good health, sustain her system properly, and enable her to lay lots of eggs when they are scarce and high. Just a little fed daily with good grains, or even with bran, as directed with each package, will do it. It can be fed either dry or as a mash. It contains no cheap filler; the hens like it, they eat it, there is no waste. It makes the cheapest Egg Food especially if you can buy your grains at home cheaper than to ship them in. Many so-called "poultry foods" and "egg-makers" are nothing but stimulants and not advisable to be fed regularly. Egg-More is not a strong tonic and stimulant, but merely contains enough condiments to give the food relish and keep the fowls in fine fettle. It will pay its cost many times over in the increased egg yield. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

Satisfaction

Is a Very Essential Feature
When You Are Buying Furniture

Do not buy furniture because it is offered on special sale at apparent great savings. If the reductions are genuine the quality is usually inferior and seldom gives satisfaction. Consider carefully the quality, style and making. It is the long use that tells the story. Furniture is not bought for one or two days' use. It is to be associated with your home for years and if it is not well made, good substantial furniture it will never give satisfaction.

Prompt delivery in perfect condition.

EGG FERTILITY.

From Mr. Schofield's talk at the recent meeting of the Los Angeles County Poultry Association, we quote:

I take for my subject tonight, fertility instead of the one that your committee has assigned to me. I was asked to talk on my first big hatch, of which there is very little to tell. My first and second hatch reminds me of the story of the Irishman that tried to kill a weasel. He said that the first lick that he hit it, he missed it, and that the next time he hit it, he hit it in the same place he missed it before. This is about the way I got my first two hatches off.

Until I came to Southern California my experience had always been with white shelled eggs, principally White Leghorn. I used to think that if an egg was fertile it would start. But I have learned by experience that although the eggs are fertile and placed in the incubator, at what is commonly considered the proper degree of heat, all will not start, many will naturally say that the fault is in the incubator and not the egg.

Our court of appeal on this subject is and probably always will be the hen; yet how many, many times have we set two hens or even more, side by side and get good hatches from one and poor from the other. Again, we often have good success hatching our eggs ourselves and sell some to a neighboring customer and they fail utterly to hatch them. Yet we know positively that we gave them fresh eggs and eggs that had the same care as the ones we set ourselves.

Cause of Poor Hatch.

I don't know as I can explain this to you satisfactorily, but we will say that a perfect egg would represent 100 points and that an egg that was not perfect, say one representing only 70 points, will hatch; then with a perfect egg we have 30 points to waste and still get a chick. This 30 points is taken or lost in various ways; for instance, your thermometer may be a little off; your parent stock may be low in vitality or may not be getting food that contains the proper amount of lime to make a shell that will retain the moisture that is in the egg; you may keep the eggs too long, or, as one party told me, he could not hatch his till they were over two weeks old.

We find that if we start our incubator at 102 degrees with white-shelled eggs, that to get a good hatch from brown-shelled eggs for the first 36 hours we must keep the heat one-half degree higher. We never keep the heat up this extra half degree longer than 36 hours for the germ lies close to the shell and the extra heat will kill your germ.

PROFESSOR ANDERSON TO BERKELEY.

A new addition has been made to the department of agriculture in the person of Leroy Anderson, at present head of the California Polytechnic School located at San Luis Obispo. The new appointment will take effect November the first. Professor Anderson's title will be that of Professor of Agricultural Practice and Director of the Farm School, while Professor Wickson's will be that of Professor of Agriculture. He became instructor in dairy husbandry at the University of California in

1900. In 1902 he became Director of the California Polytechnic School at San Luis Obispo, and has for the last five years held that post.

The Galveston News of Sept. 1 show a wonderful advancement made by the port during the past year.

Galveston ranks second among the ports of the United States in the value of foreign exports and second in the total of foreign business. Galveston ranks eighth among ocean and Gulf ports in the value of foreign imports and twelfth among customs districts. Galveston holds first place as a cotton and cotton by-products exporting port in the world.

Galveston has a minimum depth of thirty feet in the harbor channel and 23 1/4 feet on the bar. Many times vessels drawing 23 1/2 feet can put to sea.

The protection work along the beach is now so far advanced by the completion of the Seawall and the raising of the grade of more than half the area to be filled that one can get a definite idea as to how the entire work will look when completed. Galveston has a total Seawall protection of 4.37 miles, extending completely around the Gulf side of the city. Eight blocks of the Seawall Boulevard have been completed.

Why America Needs a Parcels Post?

The United States is behind the rest of the world in a good many respects. You may not have realized it, but it is a fact; and one of the places where she suffers most by comparison is her lack of a parcels

Postmaster-General Vilas wanted it, but the Post Office wanted it. Bissell wanted it. Now Mayer wants it. By the administration, he will have before the next Congress. Does America need a parcels

Post are four very definite answers

Express package weighing three pounds was sent from an American to a city of the Argentine Republic. The charges were \$6.30. The present English parcels rates, the carrying charges have been 57 cents.

Does it get this business, England or the United States?

A European merchant ordered goods from Minneapolis. The goods cost \$30. The carrying charges was

Can Europe afford to buy goods in America?

Is it a foreign business, you say, to make domestic comparisons.

At present rates for domestic parcels are 6000 per cent more than Germany's are under her parcels post.

Does it?

A domestic parcels post would save the small consumer—the people—\$250,000,000 every year.

Does it get this \$250,000,000 now?

Our big express companies get it. That's the reason they bought the idea of a parcels post so bitterly. Then the government gets some.

Opposition comes from many retailers and from country dealers. They say that a parcels post would rob them of their business and give it all to the big order houses. Doubtless there is truth in this contention, but the small dealer forgets that under a parcels post system he, knowing the needs of his trade, could order small quantities of goods at very little shipping cost; he could anticipate the needs of his trade and satisfy it all cheaply as the mailorder dealer could build up at no financial risk a very profitable commission business.

He would lose little; the consumer would gain everything.

Front Gate.

Thousands of people are not served by the express companies. A parcels post would bring the express to the front gate.

A parcels post would make every free delivery route self-supporting and would result in thousands of additional free deliveries.

Think of your express bill, and then think of what foreign countries have

Russia-Hungary sends 11-pound parcels 10 miles for 6 cents, further parcels for 12 cents. Great Britain sends 1 pound for 25 cents. France sends 2 pounds for 25 cents. Switzerland sends 11 pounds for 8 cents, and as much as 44 pounds for 33 cents. Express companies charge 64 cents for four pounds. Our postoffice sends four pounds for 16 cents.

Postmaster-General Meyer is not going to do everything in a hurry. He is willing to make haste slowly. He is willing to limit his parcels post to 10 pounds or even to 5 pounds. But he wants to make something.

Are the people the ones who save the money.

Coulson's

No. 3

Condition Powder

For Poultry

If you are not already using COULSON'S NO. 3 CONDITION POWDER, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season. If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

WE CLAIM

COULSON'S No. 3 Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in. We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are beginning to molt heavily, their combs are as bright and red as at the beginning of the season. You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably. Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want. Where the local dealer does not keep it, we will make you a SPECIAL OFFER to deliver it freight prepaid to any Railroad Station in California, at the following prices:

10-lb Package, \$1.50; 25-lb Package \$3.25;
50-lb Package, \$6; 100-lb Package, \$11.

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

GET SOME NOW AND INSURE YOURSELF
LOTS OF EGGS WHEN PRICES ARE HIGH.

Formerly of Des Moines, Iowa, and known to hundreds of clients throughout the Middle West, is now located in Los Angeles with offices at 317 West Third Street. Practice limited to the correction of the most difficult cases of defective eyesight. Forty years of continual practice. Examination free.

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

Eczema.

We have a registered Jersey cow which, since she has been in our possession—a matter of some four months—has not given more than four quarts per day. She was fresh late in fall, and about the time of purchase had not been fed properly to produce a maximum flow of milk. Along about the first of June we observed an abrasion on the skin on the side of her udder which we supposed was caused in some way by her active behavior in the corral. As the weather became warmer and the flies more active we noticed numerous small eruptions on the sides of her neck and shoulders which were a great attraction to the flies. These small sores were about an eighth of an inch in diameter covered with a scab which, when picked off, would uncover a watery exudation underneath. She now has several larger sores on various parts of her body, including one on each side of her udder, which by continual scratching she keeps fresh and unhealed. Though a young cow she has borne a very sober manner ever since these sores began to come out, and she is somewhat lame since, also.

One veterinary who examined her pronounced the trouble due to indigestion, and gave her medicine for it and advised application of diluted creolin to the sores. They began to disappear upon treatment, but a day or two ago they came on again and we called another veterinary who pronounced the case eczema at once, and has given us no hope of relief—inf her or of effecting a permanent cure. He says the sores might be temporarily dried up by a prescription which he stated would be expensive and at the same time be of no service as the trouble would be sure to come on again with warm weather and that during it her milk would be unfit for use.

Her feed has consisted principally of alfalfa hay with bran mashes and green feed in season. Her appetite has at no time been what it should be for a cow of her size and weight, nor has her consumption of water been hardly normal, even in hot weather. Inasmuch as she is a valuable animal we are not desirous of losing her if there is anything in reason that can be accomplished by treatment. While not a cow sharp, the writer is of the opinion that both veterinaries are partly right, but that neither has solved the problem or reached the root of the trouble. Can you?—R. M. C.

Eczema, or may be tubercular. Have her tested first of all. The local treatment with creolin has been good. If the cow does not react under tuberculin, then I should take her in hand and give her a change of diet, by making the ration wider, adding oil meal and a little corn, with salt. Or if more convenient, try one of the condimental foods added to her ration. The causes of eczema in the human family is indigestion, usually. Keep bowels regular with Epsom salts and give her daily a dose of one teaspoonful of bisulphite of soda for a month. These are merely suggestins, for eczema is one of the most stubborn diseases known to the doctor in the human family.

Rheumatism.

Please answer through department, is there anything that will cure a mule or horse of rheumatism. I have one that has got it and I have done everything that the veterinary surgeon has told me.—G. M., Downey.

I do not believe there is any remedy for rheumatism in a horse or mule. Take care of him by using a

blanket when he is warm and watch his kidneys; when he does not pass enough water give him some salt-petre, a teaspoonful in his feed at night and morning for a couple of days.

Indigestion.

I have a number of five and six-months-old pigs that become weak, cannot stand up, eyes seem glazed, some partly blind, others entirely. Breath seems very short; will not eat. Are that way for several hours, then get better; their feed, alfalfa, pasture, shorts and skim milk. I would greatly appreciate an answer in coming issue of Cultivator.—J. E. H.

These pigs have indigestion and should be shortened up in their feed promptly. Reduce the shorts and see that they are not constipated. Then see the pasture, what it contains? There may be some weed that they are eating of that is making them ill. The best way to read up about pigs is to take up one of the papers of the Middle West. I find most information about pigs in the Breeders' Gazette of Chicago.—M. E. S.

Lameness in Cows.

We have several cows that get lame every once in a while and the trouble seems to be between the knee and foot, but can not find anything the matter with them. We have four and all act the same way. Some have it in their front legs; some in their hind legs. It usually lasts about seven to ten days before they get over it. The cows are running in green alfalfa and get dry hay every morning.—F. H. W., Tulare.

I should look to some cause for this lameness. Either sticks in the hands of the herdsman, a dog nipping them, or else bars they have to step over. Look for some cause in the field or barn.—M. E. S.

Carnations.

Will you kindly give some suggestions in regard to the culture of carnations. Do they require a shady or sunny location, and rich or common soil? I have mine in good garden soil, in a rather sunny spot and water freely, but they do not give satisfaction. They grow well and look thrifty, but so soon get to looking old and ragged, and never bloom as profusely.—Mrs. F. T., Santa Ana.

Carnations delight in a cool atmosphere, and I think all who live inland from the coast will find it difficult to keep them looking thrifty throughout the entire summer.

The soil should be rich and the location in open sunlight. On the approach of warm weather the soil about the plants should be heavily mulched. I use fresh strawy manure from the horse stable and renew it from time to time as is needed. You must be sure to secure vigorous healthy stock in the first place, as no matter how good the care, if the plant is weak or diseased, the result will be disappointment. Our friends who live near the coast succeed admirably with the carnation in summer. While we who live inland can't have their cooler atmosphere, we must do what we can to keep the ground cool by heavy mulching, if we want any blooms during the summer months.

Borers—Sour Sap, Etc.

A subscriber whose address has been mislaid, sent the following batch of questions some time since, which were referred to H. G. Keesling, Edenville, and the answer has unavoidably delayed.

(1.) After borers have been cut out of the tree trunk this season would it be a preventative if I spray the trunks with crude oil, and soda, then later give them a coat of whitewash?

(2.) Is there any way to restore health to prune trees that have turned yellow, this season especially heavy soil? They perhaps are sapped.

(3.) Please inform me where proper and most reliable place is to send soil to have it analyzed that I might learn just how and what to use to fertilize same? And also whom I may learn as to different seeds which may be inoculated?

(1.) I have no doubt that the treatment you mention will prevent, in measure, at least, the ravages of peach tree borer. I have used

Hague Domestic Oil Burner

Showing the Method of Attaching to Cook Stove

A device for using low grade distillate. Saves 40 per cent of cost of coal or gas—let us prove it. Write for circular.

Hague Domestic Oil Burner
214 Winston St. Los Angeles, Cal.

success whitewash with some coal tar and salt added. The salt helps the whitewash to stick, and the coal tar is a good covering for the wounds made by cutting out the borers.

(2.) It is doubtful if prune trees that are sour-sapped can be restored to health. However, they may have turned yellow and dropped their leaves from some other cause, possibly lack of moisture. If so, they may recover next season.

(3.) Address Prof. E. J. Wickson, State University, Berkeley, Cal. He will doubtless direct you how to proceed to get the information you desire. H. G. Keesling, Edendale.

As to seed inoculation, the legumes, peas, beans, vetches, etc., may all be inoculated by securing soil from ground where the particular variety you wish to inoculate has been successfully grown. Care should be exercised so as not to introduce injurious fungus, that is, if your ground is to be used for melons or garden, do not get it from place where melon wilt or tomato blight existed; or if in lemon orchard, do not introduce soil from other lemon orchard where brown lem-rot has existed.

Unless sure, you can write the Department of Agriculture at Washington for the bacteria, being sure to designate the particular seed you are to plant.

Willow Posts.

Treating willow and poplar wood posts and vineyard stakes is profitable. One of the university professors suggested that it might be well to try blue stone solution the same as used for wheat smut, as a preventive of rotting. Four years ago we began to peel the stakes as fast as cut and stood the ends that were to go into the ground in a trough of blue stone water. They remain there forty-eight hours and are then laid out to dry. I think this is probably what your correspondent has in mind the other day.—M. E.

Onions.

For some information in regard to the planting of onions. What is the best kind to plant? Will

Veterinary Instruments, Black Leg and Thrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

they produce well on upland where it will be necessary to irrigate. I have good heavy sandy loam land. I expect to plant to trees and vines, and if practicable I would plant onions.—R. H. Modesto.

You can plant onions between trees or vines while they are growing, and cultivate with horse each side very cheaply.

But for fuller answer, see Mr. Longhinger's article on "Vegetable Gardening" page.

Alfalfa.

Can a cow eat enough alfalfa hay, properly cured, to hurt her? Suppose it has been cured properly, but is fed when wet with fog?

What is the difference between the bran put up in 100-lb. sacks and that put up in 80-lb. sacks?—Subscriber.

A cow that is accustomed to eat alfalfa regularly will not be apt to eat more than she can carry. I have always fed the hay outside and the cows ate all they desired without any of them overeating. I have never had it hurt them and we have heavy tule fogs in the winter time.

I do not know; I have bought Eastern bran in small sacks in carload lots. The potato sack comes in two sizes, or at least the Chinaman sells local potatoes in the barley sacks that are about the difference you quote. So may not the smaller sacks be from a different market?

"Hives."

I have a fine Jersey cow and she seems to enjoy life—good appetite, clean eyed, active, and so far as we can see perfectly healthy. She had her calf in February, but it is a three-year task—or was the last time and she seems equally slow now. She has every now and then a swelling come on the udder; one teat alone being affected—the milk coming clotted. Can you help me guess at the trouble? It has been so for a year that I know of, but the trouble occurs more frequently. Does her semi-barren condition account for it?

Just about two weeks before the birth of her calf in February she broke out all over with what would be described in humans as hives. Small swellings varying in size, but lifting the hair. We did all sorts of things for her at first attacks—salts, soda, rubbings on the spine, but on the next occasion only a few days after, we did nothing and she got well quite the same. No one seems to have ever seen anything like it before.—A. E. F.

Hives or nettle rash from indigestion is a check of perspiration or

caused by a sudden change of food. I should not give her salts if the bowels were constipated. Now I am sorry that no one around ever saw a cow that was too well fed before. They are rare I know. The udder trouble is overfeeding as well, and not milking to the last drop probably. Now, when this cow shows the trouble, cut out every other meal for a week. Her barren condition is probably from internal fat. But whether she fails to come around or fails to conceive you do not say, so it is not possible to tell you what to do for it. A general reduction of the fattening portion of this cow's food will probably bring her around all right.

Distemper.

I have a three-year-old mare; had what we thought was distemper last February; soon after swellings came on her lower jaw. One broke, but they have never gone away. At times they appear larger. Please give me a remedy and what is it?—K.

The symptoms you give are similar to distemper. But the glands remaining swollen is also a symptom of glanders. That is, if she has any discharge from the nostril on the side the swollen gland is on. If not a cantharidin blister will scatter the swelling.—W. J. Oliver, V. S.

Care of the Eyes.

Please tell me what to do for my eyes? I am a man in middle life, have never abused my eyes by long night reading nor by dissipation, but they are weak and pain me at times considerably.

The above question is answered by Dr. Polasky, 317 West Third Street, Los Angeles, as follows:

The most common eye diseases in California are what might be termed a catarrhal ophthalmia (an inflammation of the lids and the ball of the eye.) commonly caused by catarrh in the head, which in turn is caused by extreme changes in the temperature between night and day.

The application of some patent medicines or home remedies usually recommended results in iritis, the most dangerous of all eye diseases, not only destroying the sight of the eye affected, but there is great danger of losing the sight in the other eye from sympathy. The dictates of

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

good sense would really seem to be forgotten where the eye is in question; for surely, if there be any faculty of the body of preëminent importance and value, it is the faculty of seeing, and if there be any organ whose delicate and intricate structure demands the most patient and intelligent study and finished skill for its proper comprehension and successful management, it is the organ of vision. Yet this seems to be a lesson which the community is most unwilling to learn; and multitudes of eyes, too valuable to be thus thrown away, are sacrificed to ignorance and neglect.

In case of any serious eye trouble the best advice would be to consult a specialist, but if you must treat your own case you had better treat the cause, which as stated above, is catarrh.

Asparagus Rust.

This spring I planted about ten pounds asparagus seed. It made a remarkably fine growth, but when about two feet high was attacked with rust. Upon first appearance I sprayed with a strong solution of Bordeaux, but in less than two weeks the entire field was brown as an old wheat stubble. The plants are now sending up new shoots which are more or less affected with rust.

Would you advise setting these plants in the spring? Can asparagus rust be controlled?—H. W. N., Long Beach.

This question was referred to Prof. Ralph E. Smith, who answers:

I have your letter of the 2nd inst., enclosing your subscriber's question about asparagus rust.

As regards setting these roots in the spring, I have no doubt that they will make good plants if they have made the vigorous growth which is mentioned. There is no great danger of carrying over the rust by planting such roots, and the only objection to their use, is that which comes about when the growth of the seed bed stock is badly injured and the roots stunted by the disease.

The best treatment for the rust, as explained very fully in our Experiment Station Bulletins No. 165 and No. 172, consists in applying dry sulphur in summer to the tops, commencing before the rust appears. Full details of this treatment can be obtained by sending to Berkeley for these bulletins.

The tops must be well covered with sulphur before the disease appears.

In case of the seed bed it is quite an easy matter to control the disease by keeping the young growth thoroughly sulphured all through the summer. Asparagus growers in some of the worst sections near San Jose and Sacramento have been controlling the rust with great success for several years by the sulphur treatment.—Ralph E. Smith.

ANTIOAK LEATHER

Is manufactured by a chemical tanning process, the exclusive property of this company. It is Superior to any other and is produced as cheaply as any other leather. The method retains all the desirable qualities of the hide and destroys the undesirable; the result—a perfect leather.

Harness Made of Antioak Leather

Rises above competition. No other leather can compete with **Antioak**, because it excels in every desirable quality and **GIVES THE GREATEST VALUE FOR THE MONEY.** The trade must have Antioak Leather.

PACIFIC IMPLEMENT COMPANY, 131 Kansas St., San Francisco, Cal.

Are agents for the **Celebrated Antioak Harness.** For particulars write above or to

ANTIOAK LEATHER COMPANY

Tannery and Factory Alameda and Slauson Ave.

LOS ANGELES, CALIFORNIA.

Household Department

A MEMORY SYSTEM.

Forget each kindness that you do
As soon as you have done it;
Forget the praise that falls to you
The moment you have won it;
Forget the slander that you hear
Before you can repeat it;
Forget each slight, each spite, each sneer,

Whenever you may meet it.
Remember every kindness done
To you, whatever its measure;
Remember praise by others won
And pass it on with pleasure;
Remember every promise made
And keep it to the letter;
Remember those who lend you aid
And be a grateful debtor.
Remember all the happiness
That comes your way in living;
Forget each worry and distress;
Be hopeful and forgiving;
Remember good, remember truth,
Remember heaven's above you,
And you will find, through age and youth,
True joys and hearts to love you.

—Pricilla Leonard.

TAKING CARE OF BUD.

IT SEEMS to me that whenever I try to do someone a kindness I get myself into trouble. People are so unappreciative.

Yesterday our neighbor, Mrs. Babcock, brought Bud, her baby, over to our house and asked if she could leave him while she went downtown. Grandmother was asleep and no one else was at home, so, of course, I had to take charge of him. I put him on a rug on the porch and gave him some napkin rings to play with. Then I lay down in the hammock and was reading when an automobile stopped in front of the house.

"Lucile," said Arthur Knight, running up the steps, I've come to take you for a spin."

"But I have this infant on my hands," I said.

"Bring his nibs along." Arthur suggested when I had explained Bud's presence. "It's time he was learning to be a chauffeur."

But Bud didn't appear to take to motoring. He let forth such heart-rending wails after the machine got under way that I'm sure the people on the street thought we were kidnapers.

"I suppose we'll have to take him home," I sighed, as his shrieks grew louder and fiercer.

"Why, we've just got started," objected Arthur. "I wanted to run out to the golf club."

"I tell you what we can do," I said, as a sudden inspiration came to me. "We can leave Bud at Frances Marsden's. She adores children. It will be quite a treat for her to have a visit from Bud."

Just then the baby gave a fearful yell and Arthur laughed. "A musical treat?" he asked.

"Oh, he'll stop crying when he's out of the automobile," I answered him.

Sure enough there never was a seener baby than the one I handed to Mrs. Marsden's maid a few minutes later.

"It's the best joke on Frances," I said, as I stepped into the car again. "Her new maid didn't know me and she looked astonished when I gave her the baby and told her to ask Mrs. Marsden to keep him for awhile."

There was a crowd at the club having afternoon tea. We had just sat down at a table when Arthur was called to the telephone. By the time he came back I had been joined by Betty Coleman and Malcolm Cox. Arthur said his mother had asked him

to come home at once. He did not know why she wanted him, but he was punctilious about obeying wishes, so he was going to start back to town. I felt sure that he had just telephoned him because I guessed that I was with him. Mrs. Knight is one of these cold, distant women, who appear to have a great deal at any girl whom their sons take a slightest interest in. Mother's good looking sons are apt to be self-satisfied, I think.

"Stay with us, Lucile," said Betty. "Yes, do," urged Malcolm.

For a moment I hesitated and then I decided to stay. If Arthur thought I was going to run home at mother's beck and call he was mistaken.

Malcolm suggested that we go for dinner at the club and then back to town in time for the play in the evening. I called up mother and told her I shouldn't be home late.

When Malcolm took me home I found we had left Betty at her house. I was at once there was something wrong. Although it was midnight our parlor was lighted and all the family were up. As soon as we stepped on the porch Mrs. Babcock rushed out wringing her hands and sobbing hysterically. She really frightened me dreadfully. Some people are so considerate.

"What is it?" I asked anxiously. "My baby, my boy!" she moaned. "What have you done with Bud?"

"Oh, Bud," I repeated in a daze. Then I remembered Bud for the first time in several hours. "He's right," I told her. "I left him with Mrs. Marsden's this afternoon." Soon as Mrs. Babcock heard the child was safe she fainted. Every one threw showers of water on her and made the storm complete, but she looked like a thundercloud as he assured me that I was the most rational person it had ever been his misfortune to meet.

"You should have told me about the baby when you 'phoned," said mother. "I didn't know you had dinner for him. I had no idea who you were, Lucile."

Even Malcolm looked rather queer when I said he and I would go to Mrs. Marsden's and fetch Bud. I suppose he felt sorry that he did not have a motor car at his command to take me in. But he 'phoned for a taxi and we started.

The Marsden house was dark when we arrived and we had to ring the bell twice before it was answered. Then Mr. Marsden, too overcome by sleep to recognize us, appeared in a rather a sketchy costume.

"Good evening," I said. "We have called to get the baby."

"You can't have the baby," exclaimed Marsden, in a low but excited tone. "I have just got the little darling to sleep and I've decided to keep him."

"Keep him!" I said in amazement. "Yes, keep him. He was left here and now he's mine. If you want him you shouldn't have deserted him."

I rushed past Mr. Marsden and flew up the stairs to Frances. She could hardly believe her eyes when she saw me and she actually acted as if I had no right to take Bud. I simply had to snatch him away from her and run.

Heat

Where you want it—
When you want it—
No smoke—no smell—no trouble.

Often you want heat in a hurry in some room in the house, the furnace does not reach. It's so easy to pick up and carry a

PERFECTION Oil Heater

(Equipped with Smokeless Device)

to the room you want to heat—suitable for any room in the house. It has a real smokeless device absolutely preventing smoke or smell—turn the wick as high as you can or as low as you like—brass font holds 4 quarts of oil that gives out glowing heat for 9 hours. Finished in Japan and nickel—an ornament anywhere. Every heater warranted.

The Rayo Lamp

is the lamp for the student or reader. It gives a brilliant, steady light that makes study a pleasure. Made of brass, nickel plated and equipped with the latest improved central draft burner. Every lamp warranted. If you cannot obtain the Perfection Oil Heater or Rayo Lamp from your dealer write to our nearest agency for descriptive circular.

Malcolm and I were almost exhausted when we finally returned that crying child to its mother. I don't see what makes babies so fussy at night. Mrs. Babcock never even said "Thank you," after all the trouble I had been to!

If she ever asks me to take care of Bud again I shall politely decline. Father says, though, that I needn't worry, for she never will ask me.—Chicago News.

RECIPES.

Pressed Chicken.

Take a large chicken, boil in very little water. When done, take the meat from the bones, remove the skin, chop and season. Press into a large bowl, add the liquor and put on a weight. When cold, cut in slices and eat with sliced lemon or cucumber pickle.

Corn Oysters.

One pint grated sweet corn; one egg, well beaten; one-half teacup of flour. Mix well together and drop a tablespoon at a time in hot cottolene. Delicious for lunch with cold boiled ham.

To Poach Eggs.

Drop perfect eggs in a sufficient amount of boiling water to cover; do not allow them to boil; but let them steam until the white is jelly-like and the yolk entirely covered. Serve on toast.

Cream Cake.

Cream together one and one-half cup of sugar, four tablespoons of melted butter, and two eggs. Add one cup sweet milk, two teaspoons of baking powder sifted in enough flour to make a nice batter. Bake in jelly tins, and put the layers together with cream filling.

To three-fourths of a cup of sugar add one beaten egg, two teaspoons of flour, one cup of sweet milk, and flavoring to taste. Boil all together until the mixture is thick, then spread between the layers of cake.

HOMELY HINTS.

To remove blood stains, saturate with kerosene oil and let stand a few moments, then wash in cold water.

Starch is much improved by long boiling instead of being made in the usual way, by pouring the boiling water on it without further cooking.

When it is desired to remove a rusty screw which fails to yield to the screw driver, apply a heavy skewer or other piece of metal, heated red-hot, and when the screw itself is hot the trouble will be overcome.

Salt and water in proportion of four tablespoons of salt to a gallon of water will set colors, as will also ten cents worth of sugar of lead to the same proportion of water; but as the latter will also set the dirt, it is imperative that it be done before the garment is at all soiled.

A lump of camphor placed in the china closet will prevent any silver which may be in it from tarnishing.

When frying eggs have the fire low and slide them about the pan to prevent burning the thin whites.

A cloth saturated in gasoline and rubbed over porcelain bowls, tubs, etc., will remove dirt like magic.

Never hang a mirror where the sun's rays will fall upon it. The sun acts upon the mercury and clouds the glass.

It is not generally known, but to prevent cakes from burning, place a little bran at the bottom of the tins. This will save a lot of grumbling and vexation.

Williams' Shaving Stick

PERHAPS all your life you have used common soap for shaving, and have never known what it was to shave with a real shaving soap—one made just for shaving. Buy a cake of Williams' Shaving Soap or a Williams' Shaving Stick and see what a comfortable, easy thing shaving can become. There is nothing like it.

"The only kind that won't smart or dry on the face."

Send 2c. stamp for a TRIAL CAKE of Williams' Shaving Soap, or 4c. for a Williams' Shaving Stick, trial size, enough for 50 shaves. Address

Ever notice how hard some fellows work doing a small chore? It tires them as much to chop up a pint of kindlings as it would other fellows to pitch ten acres of hay. They don't go at it right. Ten chances to one, such a fellow hasn't the right tools to do the job with any way. Like as not he pieces out a broken breaching with a necktie and has to put a chalk mark on his axe to show which is the cutting side. When a man of this sort shaves he uses a paint brush, a rusty razor, and laundry soap. When his face swells up like San Juan Hill will you pity him? No, but tell him to use William's Shaving Soap and be healthy, happy and comfortable.

"By sending a 2c stamp to the manufacturers, the J. B. Williams Co., Gastonbury, Conn., to pay postage, you can obtain a free sample."

The Southern California Horticultural Society will hold its autumn exhibition on November 7, 8 and 9, at Blanchard's Hall, Los Angeles. The chrysanthemum will be queen of the show, but carnations, dahlias and many others will be in evidence.

Hemet claims the output of \$40,000 worth of potatoes.

Vegetables.

Green peas come principally from the Halfmoon Bay district and are, as a rule, late in arriving. String beans have steadily improved of late, but quotations have declined. Green corn was poor yesterday and the stock consisted of dried holdover which the trade refused to deal in. Tomatoes have brightened up and though consignments failed to show up, dealers held their carryover well in hand and were successful in obtaining 60 cents for quite a few lots. Summer squash was dull.

Grapes continue to drag with poor quality. Tokays sell most anywhere from 50 cents to 75 cents. Blacks are likewise weak and large boxes may be had at a 50 to 85-cent range. The apple market is glutted and demoralized. Dealers are glad to dispose of supplies at any price from 40 cents a box up to \$1.25 for the best varieties. Nutmegs were the only heavy receipt yesterday and their tone is decidedly weak. Prices now range as low as 25 cents a box.

odi shipped a car of "carnival grapes" in expectation that it would pay the bills left from the recent carnival. This is to be made good and fine, too, by the satisfactory sales in New York. The entire cost of the carnival was about \$9000.

MONEY REFUNDED.

To secure an almost perfect insurance for a valuable cow for \$5 is cheap, indeed. But when a whole herd may be protected from milk fever for that sum it is still cheaper. Milk fever is one of the most deadly diseases of the more valuable cows, or was up to a very few years since, when the medicated air treatment was accepted with open arms by the dairymen of the country. In tests which were made out of 914 cases of milk fever, 900 cases completely recovered. Six hours after the treatment is administered the cow will show great signs of improvement, and in twelve hours she will have recovered, and the milk will completely return in a few days.

At first, crude instruments, bicycle pumps, or any old thing, was pressed into service. But now such perfect little appliances are supplied for a nominal sum that it is almost criminal to be without them.

The Robinson Chemical Works of 249 Eighth street, San Francisco, supplies a complete outfit for \$5, which they say "will positively cure or money refunded."

EVERY FARMER CAN HAVE HIS OWN TELEPHONE.

Nowadays, it is possible for every farmer to have as many conveniences and comforts as his city brother. In fact, the up-to-date farmer demands that he have the best of everything. He is on the lookout for any new device that will save him time and labor and increase the efficiency of his farm.

Thus it is that the telephone has become as much of a necessity on the farm as it is in the city. It enables the farmer to keep in close touch with his markets, sell his hogs, cattle, stock or other products; hire his help, bring the latest news from the neighborhood, the nearest town, the State, to say nothing of its social features. The telephone on the farm has come to stay and the Telephone & Electric Equipment Co., Seattle, San Francisco, Los Angeles, are showing the farmers how they can put in their own tele-

phones at reasonable cost. Their advertisement in this issue is certainly worth reading. They send three books on Farmers' Phones, free of charge. The booklet on "How the Telephone Helps the Farmer" is especially interesting, and we urge all our readers to answer their advertisement. Ask for the 25th edition.

A FARM ECONOMY.

The use of a "food tonic" as a preventive of indigestion and consequent check on growth and development, is becoming a settled practice among owners and feeders of live stock.

It is a well-established principle that bitter tonics strengthen digestion, that iron builds rich blood in abundance and that nitrates remove from the system the clogging poisons that are not less deadly because their action is slow. It sometimes happens in feeding cattle or hogs that the gain of months is almost completely lost by a mistaken idea of economy which prevented a slight outlay for the "food tonic."

This is a sample of the same old policy which "saves at the spigot to waste at the bung."

Continuous and rapid growth or fattening is impossible without daily doses of this beneficial tonic preparation.

Keep that in mind and remember that back of the idea is the indorsement of such men as Professors Winslow, Quitman and Finley Dun, noted the country over as experts in all that relates to veterinary medical practice.

It has been found that all farm animals are equally benefited by the use of the "food tonic." Horses are in better condition for work or driving, and where the object is to sell they invariably show to better advantage. To hasten a bunch of hogs when high prices are in prospect, there is nothing better, and the actual profit derived from its use may be well illustrated by a simple computation.

Suppose a bunch of four 125-lb. hogs be taken as an experiment and that a maximum dose of two tablespoonfuls be given twice a day. Now, the actual weight of tonic eaten by the four hogs would be one-sixth of a pound and would cost five-sixths of one cent

or a fraction over six cents per month, per hog. Then if the fact be taken into consideration that a thrifty hog may increase a hundredweight in a few weeks, we see at once that the "food tonic" would soon pay for itself and a large margin of profit be realized.

This is the theory and practice of the "tonic idea" and there is abundant evidence to sustain it. Men who are using the "food tonic" regularly, find that there is no small investment made that gives so handsome a return.

The larger business of cattle raising and feeding is also equally broadened and extended by this commonly practiced principle of giving a digestive tonic. By its use a bunch of steers is carried safely through the months when heavy feeding is the rule, and brought to a satisfactory market condition without a moment's check in the process of development.

Sheep and lambs benefit as much from a consistent use of "food tonic" as other stock, tests by a State experiment station proving in one instance a profit of 235 per cent over the cost, from which it would seem that no farm economy is more practical or profitable than the "food tonic" idea.

TWO OLD—ONE NEW.

Two firms which have long bought and sold hay in Los Angeles are the Nichols-Hammell Co. and the Loomis Bros. These two firms are now become the Nichols-Hammell-Loomis Co. and are handling hay in a large way. In fact, the firm says in their circular:

We feel a degree of pardonable pride value of our business—during the last twelve months the Nicholls-Hammell Co. alone marketed 25,000 tons of hay. We are now the largest hay firm in Southern California; we trust your past relations with the men identified with our new organization have convinced you that you can here supply your needs in hay to the best advantage.

The hay producer should get in touch with them.

Glenn county had a serious stubble fire near Willows last week.

TALLERDAY MANUFACTURING CO.

636-7 Pacific Electric Building

Los Angeles, Cal.

Does this stream of water look good to you?
It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs. It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.
How many pump users can say this?
It shows conclusively that it pays to install good machinery.
We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it.
Mail us a card asking for it today.

Forests the Source of Irrigation Waters

DURING three months (January, February and March, 1899,) observations on the forested basins, about three-eighths of the precipitation appeared in the run-off; while in the non-forested area, nineteen-twentieths appeared in the run-off. The forested area experienced a well sustained stream flow three months after the close of the rainy season.—Toumey, in report of Tri-counties Reforestation Committee.

THE non-forested area, which during December, experienced a run-off of forty per cent of the rainfall, and which during the three months following had a run-off of ninety-five per cent of the precipitation, experienced a run-off in April (per square mile) of less than one-third of that from the forested catchment areas, and in June the flow from the non-forested area had ceased altogether.—Toumey, in report of Tri-Counties Reforestation Committee.

The P. & O. Canton

Success Plow

A
Frameless Plow
That Will
Last a Lifetime

The Best and Cheapest Plow is the Success.
Why?

Because it does the same work as plows that cost a great deal more.
It costs less than higher priced plows because it is made of fewer parts.
On account of its having fewer parts it won't get out of order.

Plows get out of order because they are complicated. The Success isn't complicated—it's very simple.

A plow that won't get out of order is what you want, isn't it? You would call such a plow **strong and durable**.

That's why the Success Plow is named "**SUCCESS**."

Being less expensive than others, doing first-class work, possessing the essential qualities of strength and durability, the Success deserves all we claim for it. No use to ask now why it is the cheapest.

The best is always the cheapest.

Equipped with the best bottoms made; adjustable front axle; dust-proof removable wheel boxes; adjustable rear wheel; easily set for any depth; works equally well with large or small horses; has light draft and is easily operated—a perfect plow.

Irrigated Lands Demand Reforestation

The Organization of the Tri-Counties Reforestation Committee Urging the Great Work of Replanting Our Watersheds

THREE counties in the southern part of the State have combined in the organization of a committee, the duty of which is to look after the interests of reforesting the mountains which supply those particular counties with the life-giving water. These counties are San Bernardino, Riverside and Orange, each county having twelve members on the committee.

The officers of the committee are Francis Cuttle, president and L. A. Finch, secretary.

To be more particular as to the objects of the organization, we quote from its literature:

The object of the organization is to diminish the winter and spring run-off and increase the summer flow of water from the San Bernardino watershed.

First.—By securing to the Federal Government the ownership of all lands within the outside boundaries of the San Bernardino Forest Reserve.

Second.—By preventing the further destruction of timber and brush within the said reserve.

Third.—By reforesting all denuded areas.

Fourth.—By affording, where practicable, all lands not now covered with sufficient timber to preserve to the best advantage the precipitation falling on the said Reserve.

The committee has held several meetings and is moving in the matter of giving much information as to the necessity of early action in securing immunity from fires, and of urging upon the Department at Washington the importance of reforestation, and of afforesting where possible.

The last meeting was held at Redlands a few weeks since, at which time President Cuttle reported regarding the work of the committee and he said:

President Cuttle Reports.

In the address made before the National Irrigation Congress, I stated that the people of San Bernardino, Riverside and Orange counties have found, up to this time, that they were unable to settle their differences as to the ownership of water among themselves and recourse had often been had to the courts, and that litigation would probably be had in the future, as it had been in the past, over the ownership and division of the water from the south slope of the San Bernardino mountains, but that while these people had agreed to disagree on these subjects, they were broad-minded enough to unite in an organization where all could work harmoniously for the preservation of the timber at the source of the water supply and the conservation of the precipitation which would, undoubtedly, be of great benefit to all of the three counties. Litigation has certainly broken out again in real earnest between the different owners and claimants of the waters from the south slope of the San Bernardino mountains, and I desire here to urge on the members of this committee the necessity of laying aside all personal prejudice that may arise over the litigation that has recently been instituted between the counties of Orange and Riverside, and Riverside and San Bernardino, when it comes to working through this committee for the protection of all. Let us fight, if we must, in good earnest over the division of the water we now have, but at the same time, let us continue to work harmoniously together to increase the summer flow of water in order that all may be benefited, and in the hope

that eventually there will be sufficient water so that litigation will be unnecessary.

Trees Doing Well.

I recently made a short trip into the San Bernardino mountains to examine personally the condition of the trees that were planted during the early part of the year, and was delighted to find in the batch of trees that I visited, about midway between the Arrowhead hotel and the top of the mountain, that of the fifty-nine trees I examined, there were fifty-two living and but seven dead. The living trees were not only alive, but were vigorous and green, and some had made good growth. This was just before the recent rainfall. I do not mean to say that this percentage can be maintained in all plantings, but the location I visited was certainly as unfavorable as could be selected. The ground is very dry, sterile and stony in composition, on the south slope of the mountains where no moisture excepting the rainfall can possibly reach the trees, and yet they are all doing remarkably well.

Some Facts.

At the same time Mr. Geo. Robertson, of Redlands, presented a statistical report from which we quote:

Without a wise management of our San Bernardino Forest Reserve, no agricultural industry depending on irrigation in this valley is a safe investment; but with an intelligent forest policy, satisfactorily carried out, these irrigated lands are bound to be among the most productive and valuable on the face of the earth.

The value of the San Bernardino Forest Reserve does not lie so much in its merchantable timber, its minerals or game, but rather in its influence on climate, its source of irrigation water and in its hydraulic power for electric plants. Any effort which aims to protect or add to these values should merit the attention of all the people of the three counties represented here today.

The reserve forms an important part of the 150 or more forest reserves of the United States, and contains more than 730,000 acres; 310,000 acres are timbered, 370,000 brush covered, 40,000 desert and naked rocks, 15,000 meadow land, 1200 cultivated tracts and 800 acres occupied by streams.

Some years ago a movement began in this city to persuade the Federal Government to purchase all the private lands within the outside boundaries of the San Bernardino Forest Reserve. We are pleased that this is now a primary plank in the Tri-Counties Committee's platform.

The careless skinning the land of timber for lumber is nearing an end in Southern California.

Again the destructive fires which have destroyed thousands of acres of most valuable forest cover can nearly all be traced to fires originating on the private lands either in or contiguous to the forest reserves.

Perseverance of Saints.

Only the perseverance of the saints will protect our inflammable and gummy chaparral from destruction by fire, if we neglect fire protection.

We are now able to lay before you the amount of acreage of patented lands in the reserves, the names of the corporations or individual owners; their several holdings; the precise location of each parcel or land as to township and section.

Six hundred and forty acres have been reserved

in township one for Indian purposes. We doubt the wisdom of locating Indians on lands in the reserve where forest fires may escape and do immense damage to the forest cover of the watershed. Ought we to establish a continuous menace to the valuable valley interests? Your committee believes it would be a wise policy to have these 640 acres exchanged for land outside the reserve. The government should take possession of these 640 acres.

Eleven thousand, two hundred eighty-nine and ninety-six-one hundredths acres are owned by private parties. These lands are widely distributed in townships one and two.

Fifteen thousand and sixty-three and fifty-four-one hundredths acres are owned by the Southern Pacific Railroad company. The lands of this corporation are about equally distributed between townships one and two. Also 6400 acres in the reserve belong to the State.

This means a total of 32,751.50 acres is now owned by private parties, corporations or State. Careful statemanship will be required to unite all these interests, located now within the reserve, into line with the best interests of the people in these three counties, who depend for their very existence on the irrigation water supplied by the San Bernardino watershed. As our population grows, and it is bound to increase year by year, this problem will grow more pressing. There is one and only one problem—work the forestry problem first and work it right.

The extent and economic value of the irrigated lands in the San Bernardino valley depending on the watershed cannot be omitted.

We are indebted to H. B. Wilson, county assessor, and secretaries of boards of trade for Highland, Colton, Redlands and others for valuable information.

From the county assessor we learn that the total acreage of lands irrigated by water from the San Bernardino watershed is 102,051 acres; that the assessed value of these lands is \$3,809,350, and the market value is \$22,856,100. The value of the crops on this land last year amounted to over \$5,000,000.

Since the irrigated land industries for San Bernardino county alone amounts to this vast sum, what must be the economic value of the interests of our three counties depending on this same watershed? Every drop of water saved by wise forestry is gold to the average orange growers.

Where there are no obstacles, as on barren ground, the moving water, by eroding channels, forms small rivulets, and these larger and larger ones, which flow with constantly increasing velocity. As a result, the water passes rapidly over the surface and but little gets into the soil. When the soil is covered with obstructions, such as are offered by a forest with its accumulation of litter and vegetable growth, the rain which is not immediately absorbed is checked in its flow over the surface. The water being held back, is finally taken up by the soil and thus prevented from forming small rivulets through erosive action. The forest, in extending the time during which the rain reaches the soil, in its effect upon local topography, and in supplying a larger and better absorbing medium, must necessarily have a profound influence in increasing the seepage run-off, and in proportionately decreasing the surface flow.—Toumey.

Imperial Valley Farms

Wonderful Opportunities
for "Real Farmers."

Cantaloupes, Grapes, Onions, Asparagus, and all garden produce get the early market and thus the high prices.

Alfalfa, Hogs, Dairy Cows, Sheep and Beef Cattle cannot be raised anywhere with greater profit.

The great need of the Valley is for "real farmers." At present you can buy lands at the same prices as some improved lands are now renting for. The Valley is fast becoming the Great Feeding Ground of the Southwest.

Cantaloupe and garden land to lease for cash or on shares.

BLACK SCALE FUMIGATION.

NOW that the season for fumigation is well under way, it seems opportune to cite a few mistakes which have already become evident. During the past summer the black scale has been more irregular in its hatching than for several seasons past. Though many of the young were hatched before the hot weather in July and an early year was anticipated, the reverse condition has actually been found to exist. During this hot weather much of the earlier brood was killed and a uniform hatch afterward seemed to be assured, but the young have since been very slow in coming out, so that in the older, denser citrus trees it was really the first of October before fumigation with ordinary black scale dosage could be recommended with any assurance of a complete kill.

In some districts fumigation for this pest began early in August and, as might have been expected, very poor results have ensued. This is evidently due to negligence or ignorance on the part of the inspectors or fumigators, or both. The question which naturally arises is: How should this be governed, and who should be the judge? Evidently the fault lies with both the inspectors and fumigators. Because early fumigation was successful last year, there is no reason to suppose that it will be so this year, and the inspector or fumigator who advises fumigation before the scale is in a condition to be killed should be held responsible by the orchardists and should be so amenable to the laws that he will be compelled to make reparation, unless he stipulates definitely that a complete kill cannot be affected, and the grower then sees fit to take the chances. The whole scheme of control by fumigation is based upon the invulnerability of the egg stage, and it is a well-known fact that even a red scale dose will not be effective against the egg of black scale. A good example of this came before my attention some weeks ago when I visited some trees which had been treated early in September with what is known as "a heavy black scale dose." Though a large per cent of the red scales, which were abundant on the trees, were killed many young of the black scale had emerged from the old shells since the place was treated, and many eggs were still unhatched.

An inspector informed me some time ago that the eggs and young of black scale which still remained under the shell could easily be killed by fumigation after the first young had emerged and thus "loosened up" the remains of the parent's scale. This inspector has been in the business for a number of years and it is evident that this lack of common knowledge is merely due to a lack of careful and intelligent observation. Such an inspector should soon be recognized by his constituents and superiors in office as totally unfit for his duties, and his removal would be a blessing to the community in which he operates.

Much of this early fumigation is done because of the oft repeated fact that if everyone who is to have it done this season were to wait until the scale is ready, all would not get their work done before the young scales have formed their protective

covering and thus become practically immune to control. This means. This is partially but appears to be, indeed, a poor excuse, for who shall be victimized order to adjust this difficulty. Nearly all of the largest growers have purchased their own outfit that their work may be done. It is exactly due, and a combination of small growers could evidently cure the same ends by thus equipping themselves, or by together curing from some contractor an agreed agreement for fumigation in a certain period. It might be said, too, that the proposition of terminating the season in groves of same section is adjusting this matter so that there are in many a sufficient fumigators to cover territory necessary each year, further, that many of our best fumigators make preliminary inspection and refuse to do the work except the proper time or else come to understanding with the owner concerning the results to be expected.

While much in regard to fumigation must await the investigation now under way here by the government, as the result of an urgent request from our county commissioners, these cardinal and basic facts necessary for good work should be the stock in trade of all inspectors and fumigators, else the orange and lemon growers must be injured rather than aided by the so-called public servants, as a result of the desire to live up to the recommendations of Mr. Powell in which states that clean groves are a primary necessity for fruit of good shipping qualities.—B. J. Jones.

CAREFUL ORANGE HANDLING PAYS.

In an article in the Rivers Press, J. H. Reed appeals for more closely following the recommendations of G. Harold Powell and show the financial advantage to all producers secured by the additional care. From the article we quote:

For the Small Grower.

Naturally, the greatest benefit so far has come to a comparatively few large growers packing their own fruit—progressive men, always on the alert to secure and utilize improved methods.

The question now is, can the results from these investigations, utilized by the average small grower and others not in the position to pack their own product? Will they pay to make the effort?

After the large growers, handling their own fruit, those connected with co-operative associations, probably are in the next best position, to secure the intelligent handling required.

The associations connected with the fruit exchange pack say 4,000 boxes per annum. It has been shown that those who have efficiently carried out the methods indicated by Mr. Powell's experiments, have secured thereby a net gain of from 50 cents to \$1.50 per box. Now suppose the average savings on the output of the exchange association could be made 25 cents per box—of half of the minimum amount saved by private concerns—an aggregate of one million dollars in a season, and to the individual grower of a thousand and packed boxes a saving of \$250.

certainly would be worth while.
Bits a Box Saved.
 After following the investigations carefully from the first as well as the publication of their results in a practical way, by houses giving them enough test, I am satisfied that more than \$500 may be saved on 1000 boxes, packed for the grower by any association to secure the necessary cooperation of its patrons, or \$54,000 300-car pack; certainly a nice sum to be distributed to patrons for the little trouble and expense of carrying out the improved methods.

Now this is to be done is not yet easily stated. In fact, probably considerable experimenting will be required before it can be known with assurance. Different methods will have to be tested before the successful is found. But entering orange growers have overcome greater difficulties, and they will overcome this.

Expert Supervision.

Without the first and most important step required is the control of the fruit to be packed by a reliable concern. Since much of the trouble resulting in decay sooner or later, before the fruit reaches the packing houses, may be of such character as not to be detected there at the packing house—the only way it can be controlled is by careful expert supervision from the time it leaves the tree. This problem of pickers, handling all the fruit could best be done by a trained crew, under capable supervision.

Where this plan is found seemingly impracticable (I say seemingly, because I believe the objections against it may be overcome by the advantage of all concerned) the only alternative will be where picking for the various patrons and the associations is done strictly under the supervision of an expert to employ of the association.

This field supervision should also be in the manner of handling the fruit in the field and its conveyance to the packing house, under the direct regulations of the management of the association. Under either the cost of picking will necessarily be increased over that of the other methods, but this increase under strictest supervision would be negligible compared with the gain.

When the fruit delivered in unimpaired condition, not only rigid inspection of careful handling at every step must be required by the management, but methods and appliances found objectionable by Mr. Will's investigations must be discarded. The necessity of careful handling in the packing house to secure desired results is as absolute as in the orchard.

Let Them Leave.

It is insisted by some that patrons of co-operative associations will not submit to the rigid requirements in the field necessary to secure uniform handling. This may be the case in some instances, but where the importance of the new movement is fairly well understood, I believe the exceptions will be few, and where one would leave the association because of the restrictions, I believe, as a rule, two or more would ask admission because of the same.

It will take time to have the im-

portance of this advanced step in our industry generally and fully understood, but I am satisfied that in most orange growing sections, it is already sufficiently well appreciated to justify an effort for the radical changes of methods called for. I believe that co-operative associations at least should at once formulate plans for the coming season, where not already done, to secure the careful handling of their fruit that has already proved so profitable to firms and individuals packing their own fruit.

CROSS INOCULATION OF LEGUMES.

The question about the possibility of using one form of bacteria for the promiscuous inoculation of legumes has not been definitely settled as yet, still there has been some interesting work along that line. It was demonstrated many years ago that there were certain groups of legumes that would readily become inoculated by one pure culture. The idea was advanced that when a change of variety of legumes was made in a soil, the bacteria went through some sort of evolution that permitted them to perform their functions in the new host. This was simply theory with no proof that such was the case.

Recent experiments carried on in London showed that if such an evolution does take place, it must be indeed be very rapid and entirely within the influence of each separate (supposed) variety of bacteria. It is stated that tubercles obtained direct from wattles (acacias) in Western Australia, were sterilized and cut under sterilized conditions and pure cultures made. After several days incubation, sterilized sweet pea and vetch seeds were inoculated with the culture and grown in sterilized sand. Uninoculated seeds were grown in sterilized sand and no nodules were produced on the roots. The peas and vetch inoculated with the pure acacia culture all produced nodules.

ORANGES BY THE SHIPLOAD.

Whole cargoes of oranges from the orchards of Southern California will be shipped direct to the markets of Europe the coming winter if the plans which an English syndicate is making are successful. A representative of a London syndicate which sees profit in the sale of California oranges in Europe has been in the southern part of the State for several weeks investigating the supply and the means employed in shipping fruit. He has now gone to Galveston to make arrangements to engage wharf facilities for the first steamer the syndicate will send to that port. The plan is to load full cargoes of oranges on trains in Los Angeles, ship them direct to Galveston and thence to the markets of Europe on a steamer chartered for that purpose. —Chicago Packer.

AND THEN HE WENT.

Little Brother—"Do you know what I think?"
 Sister—"No; what is it?"
 "I think if I were not in the room Mr. Jones would kiss you."
 "You impudent boy! Leave the room instantly!"

An average of \$6.80 for a car of Santa Ana oranges was received by the Santiago Orange Growers' Association.

Riverside oranges are showing many splits.

PUMP IRRIGATION

AN I.H.C. ENGINE
 WILL GIVE YOU ALL
 THE HEAD YOU CAN
 TAKE CARE OF

If you have to depend upon the pump for irrigating your land, you must have a powerful engine.

Formerly irrigation on a large scale by pumping was thought to be impracticable. But that was before the days of the I. H. C. engines.

In building engines for irrigation purposes it is necessary for the designers to take into account the fact that water must be raised in quantities, and that frequently it must be raised to a considerable height.

The use of hundreds of I. H. C. engines by practical irrigators is evidence of how well these requirements have been met, and how well the I. H. C. engines are adapted for this special work.

The engines are not only powerful, but they have the two other absolutely necessary requirements:

They do your pumping economically.

They run dependably with practically no attention.

Irrigators of large tracts of land must have an engine that is economical in fuel consumption. The I. H. C. engines have reduced fuel consumption to a very low minimum.

It isn't necessary to keep an extra man to attend to the engine. Only an occasional return to the engine is necessary, or a small boy can give it all the attention required.

If you have a lake or stream below your land, or ditch, just look into the matter and see how well an I. H. C. engine will solve your irrigating problem.

Vertical engines made in 2 and 3-Horse Power.

Horizontal (portable and stationary), in 4, 6, 8, 10, 12, 15 and 20-Horse Power.

Climax Ensilage Cutters

In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in a much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequalled in simplicity, strength and durability, convenience and safety in operation, and the excellent quality and uniformity of the silage.

We received at the

St. Louis Fair the Only Award

for ensilage cutters of the side-wheel type, 15 to 25 tons of green corn per hour, where cut in one-half-inch lengths, other feed in proportion. For further particulars, call on or address

Live Stock and Dairy

SMALL CHEESES.

THERE are a number of desirable kinds of small cheeses made for immediate consumption, that do not require curing. We used to find a ready market in our little town for all that we could make. Where cows are kept as a side issue, they are not usually bred to freshen when milk and butter are selling at the highest price. Whenever the returns from the creamery falls below the line of profit, then a woman can make these little cheeses and secure some needed pin money. The market is never filled with an over-supply of pot or cream cheese. How easy it is to secure a reputation for this kind of cheese, is shown by an offer from a San Francisco retail grocery firm to take for the next six months all the cream cheese we would make for them. We have not made them for sale for nine years, yet some one remembered them as desirable.

Cream Cheese.

This is the recipe that came to me from my aunt's home in France. The peasants make it for the Paris market. The consumption reaches about two hundred and fifty thousand pounds a week. When eaten French fashion with a loaf of crusty bread hot from the oven, with a little lettuce and good coffee, it makes a lunch fit for the gods, let alone a blasé club man.

To one and a quarter gallons of twenty per cent cream, this is about the usual commercial cream of the market, add eight gallons of new milk. Reduce the temperature to between 55 and 60 degrees; add a little more than half the amount of rennet the chesse tablet calls for, in the making of ordinary cheese.

The Curds.

Let the milk stand twenty-four hours until well clabbered. Then take the curds up on four pieces of cheese cloth, tying them up loosely like a bag of pudding. Prepare some cans, baking powder will answer nicely, by melting or cutting off the bottom so as to make an open cylinder. Cut out a few little, round pieces for followers. Put some doubled flour sacks on a board and stand on it one of the bottomless cans. Put in a little bag of the curds, then a wooden follower, then more curds and at the top allow curd bags to project half an inch to make it a good full can. Now on this lay a doubled flour sack and on that a level board and put on a couple of flat irons for weights.

Working.

After twenty-four hours spread the curds in a kneading pan or butter bowl. Work and knead in salt and sweet cream. Pat into a long roll and stand to one side until it grows firm. If for home use make it into small pats about a dozen to the pound; this is about the size of codfish balls. Put these into pieces of cheese cloth and wrap them in prepared waxed butter paper. These cheeses must be neatly put up, if it is desired to market them, for we rightly judge the maker by the style of his goods. A clean person will be neater than a dirty one every time. Our little dairy actions rise up to judge us just as surely as

the crisis in life show our character.

Moulds.

Small, round moulds made of tin are desirable to shape cheeses. I found it well, however, to buy in quantity the small, pasteboard forms, that come for individual charlotte russes. A strip of parafined paper is put first. These moulds are sold for the cheese and protect it from getting out of shape. A second piece of butter parchment is wrapped around the outside of it and a circular label with the maker's name and date is made on it. The circle of fancy paper is pasted on each. The handling by the grocery cannot contaminate a cheese so long as it is sealed in this way. These cheeses will remain good if kept in a cool place for a couple of weeks. I say good, but I know people who deliberately put them away and eat them when they mould and are at least, two months older than when they are new.

Another French Recipe.

This little cheese has not proved as popular as the first one given here. It is not as rich, yet is excellent as a table cheese. Put the morning's milk into a granite pan, adding the rennet according to printed directions. Stir it well and raise the heat to seventy degrees. Cover it and wrap it up to hold the heat at seventy for three hours. Then stand the pan in a cool place until the next morning. Cover with a colander with a piece of fresh scalded cheese cloth. Take up the curd with a perforated ladle or with the ordinary hand skimmer. Lay the curd on the cloth, when it is all out of the pan, tie the cloth up into a bag and hang over the pan to drain for an hour. Then put the curd in the butter bowl and add a tablespoonful of heavy cream for every two cups of the curds; season with white pepper and salt to taste, and work until a smooth mass; roll into a roll two inches thick and cut it into fancy shapes with a cheese cutter. This cheese keeps for a week. If it is for sale, cut it into rounds or squares, wrapping it in the butter parchment and seal with one of the circular stickers with your name on it and date of making.

English Sour Curds.

One of my neighbors from Sussex, England, gives me the following recipe being something extra good. I have not tried it myself, but can see the reason why it should not be good. It is usually eaten on bread with Barle Duc jam at afternoon tea. Take thick cream that is turning a little sour. Put it into a piece of clean table linen and hang it up in a cool, sweet place over a pan to drip. Knead the bag gently every few hours to help the whey escape. After twenty-four hours take out the curd and rub it smooth. Salt and pepper it lightly. Press it into after-dinner coffee cups or into ordinary coffee cups, and when set turn out on a glass plate; cut it into slices like a pie and then each person spreads it over rye or graham bread and put on the currant jelly. The whole performance reminds me

the "spreads" of Schmierkase and
apple butter the Pennsylvania Dutch
people give their children to "piece"
at the long mornings from before-
dawn breakfast and to the noon-
the dinner.

At Cheese.

This is made almost everywhere,
I do find someone once in a
while, that asks me how to make it.
Take sour buttermilk or skimmed
milk that has turned. Put it on the
back part of the stove, cover and let
stand until the curd squeaks when
pressed between the fingers. Then
drain off the whey by putting the
curds into a piece of cheese cloth.
Squeeze the curd down fine with the po-
tomasher. Add salt and some
cream. Some people like a dash of
away seed in it. At an Easter
dinner last year we used it to make
eggs to decorate a salad. The cheese
is colored with spinach juice and
molded into tiny, light green eggs.
When made for market it is simply
made up into balls without season-
ing of any sort. These cheeses can
be ripened in a pound ball; it ripens
strong and is then sold, as a form of
Dutch cheese, mostly to the saloon
trade. The ripening is usually done
by putting the ball into a heavy cot-
ton sack and hanging it outside in
a place where the sun will not di-
rectly strike it, nor where it will be
fined upon. After a month it is
usually considered ready to eat.
Why this does not poison the eater
I do not know; I can assure you
however, when I was a child that I
used to see many of the cheeses be-
ing ripened under the eaves of the
dutch milkhouses.

Dutchatel.

Now this is the way my Swiss
farmers treat a form of cheese that
is not at all expensive to make.
It five gallons of new milk in a
one jar and add enough rennet to
make a slow forming curd, about
half the quantity used in regular
cheese making. Do not warm it, but
tap it up to secure even tempera-
ture. After twenty-four hours it
should be curded. Then put the
curds into a sieve, or hang up in a
cheese cloth bag. After draining
twelve hours it is put into a cheese
ring and pressed over night. It is
then kneaded on a table until it is
stiff paste. Should it not be stiff, it
can be dried out by kneading it on
a clean napkin that has been made
hot in the oven. When stiff put into
small tin moulds. Any round tin
box with the bottom unsoldered will
answer the purpose. After packing
the curd smoothly slide the little cheese
out and roll between the hands,
sprinkling on plenty of fine salt;
rub the salt in until no more will
stick. Then put the cheese on a
piece of well scrubbed straw mat-
ting to cure. This cheese can be
eaten as soon as made, but is better
to leave it longer. After ten or
fifteen days the white mould that
has already been thick upon the
cheese turns blue. Then the cheese
should be put into a cellar; stand
some vessels of water around them;
sprinkle the floor daily in the dry
weather to keep the air moist.
When red spots appear the cheese is
ready to be eaten. I am not sure
that Americans will like these
cheeses, but there is a good sale for
them wherever there are foreigners.
It is said to be extra good to eat
with bread and "Dago red."—M. E.
Sermon.

From Calf to Yearling

A horse, cow or steer—any domestic animal—is, in a sense, what the breeder makes it. An inherited tendency toward heavy milking or capacity for fattening may be intensified by judicious management on the part of the feeder until succeeding generations excel the parent stock. The feeder can change an unthrifty animal into one that proves profitable. This developing of characteristics is made possible by the modern science of feeding as understood by up-to-date farmers. Hence the first twelve months in the life of a calf become of vital importance as largely determining its future usefulness. Now, to rightly develop a calf with large appetite, it's necessary to *strengthen digestion* so that increasing ration may be met by increasing appetite and no derangement result from over-feeding. To do this, give regularly, twice a day, small doses of

DR HESS STOCK FOOD

ATONIC

In the grain ration. This is the prescription of Dr. Hess (M.D., D.V.S.) and contains bitter tonics, iron for the blood and proper nitrates to cleanse the system. It acts upon the digestive organs, correcting any tendency toward indigestion and enabling the animal to assimilate great quantities of food; hence compels rapid growth and permanently fixes the feeding habit.

Dr. Hess Stock Food gives increased appetite for roughage and, by aiding digestion, prevents much loss of nutriment in the manure. Corrects all minor stock ailments and costs but a penny a day for a horse, cow, hog or steer. Its ingredients are endorsed by Professors Quitman, Winslow and Finley Dun, the greatest medical writers of the age.

Sold on a written guarantee.

100 lbs. \$7.00; 25 lb. pail \$2.00
Smaller quantities at a slight advance.

Where Dr. Hess Stock Food differs in particular is in the dose—it's small and fed but twice a day, which proves it has the most digestive strength to the pound. Our government recognizes Dr. Hess Stock Food as a medicinal compound, and this paper is back of the guarantee.

Free from the 1st to the 10th of each month—Dr. Hess (M.D., D.V.S.) will prescribe for your ailing animals. You can have his 96-page Veterinary Book any time for the asking. Mention this paper.

DR. HESS & CLARK, Ashland, Ohio.

Carriages, Harness, Farm Wagons, Feed Cutters; Corn Shellers, Drills, etc.

CORN A PROFITABLE CROP.

In the eastern States, where dairy-
ing is a large industry, more land
may be devoted to corn, not for sale
or exportation, but to feed on the
farm from the silo, or as a grain to
the cattle and hogs and thus save
purchasing. For the protein needed
to balance the ration, clover or alfal-
fa may be grown for roughage and
soy beans will give the protein con-
centrate required.

These crops should make the dairy
farmer almost independent, as little
bran would be required. Then let
him weed out his dairy, keeping no
cow that does not give over 6000
pounds of milk, or make 300 pounds
of butter in a year. Corn, in my
opinion, cannot be grown in the mid-
dle and eastern States in competi-
tion with the great West, for ship-
ment. The grain and stover must
be utilized on the farm and marketed
in live stock or dairy products, to
make the corn crop profitable.

SAVES MONEY.

Find enclosed \$1.00 for your wel-
come Cultivator, as it truly proves
to be a good culture to all who read
it, as well as beneficial financially as
it will save its careful, thoughtful
readers money.

I would be pleased to see some one
who has good macaroni or durum
wheat for sale, to let his address
with price be seen in the ad column
of the Cultivator.—R. M. Burney, Ra-
mona.

WHY BE A DAIRYMAN.

In the opening of an article pre-
pared for the recent California
Breeders' Convention at Sacramento,
Mr. Claud D. Tribble, of Elk Grove,
gave a very clear answer to the
question "why be a dairyman?"
From it we quote:

In the beginning it may be asked,
why be a dairyman? In reply we
will state that dairying has many
things to influence the average
farmer in its favor. These are not
new. You have heard of them or
thought them out for yourself. In
the first place, the business is ex-
ceptionally profitable. It furnishes
a constant income, and the demand
for dairy products is never ceasing.
It builds up the fertility of the soil,
thus making your farm more pro-
ductive instead of sapping its re-
sources. The man who ignores
dairying and farms for the grain or
stock he can sell is sure to injure the
fertility of his farm sooner or later.
Evidence of this is plainly seen on
many of our farms. The Ohio Ex-
periment Station has recently made
public some figures relating to the
difference in the products sold from
the farm in regard to retaining its
fertility. According to these figures,
when a man sells \$2 worth of
straw from his farm he sells as much
fertility; that is, removes it from the
farm, as he would sell \$80 worth of
butter. When he sells \$18 worth of
oats he removes as much fertility
from his farm as he would in sell-
ing \$325 worth of cream. In selling
\$20 worth of wheat at 80 cents a
bushel, he losses in fertility as
though he sold \$290 worth of cream.

Some people will believe an argu-
ment like this when you are selling
hay or grain from the farm, but they
say there is very little difference in
the effect upon the fertility whether
you keep cows or fatten steers or
hogs, or in fact, practice any branch
of the livestock husbandry. The
Ohio Experiment Station, however,
is authority for saying that when a
man sells \$100 worth of beef at five
cents a pound, he removes as much
fertility as he would in selling \$500
worth of butter; also that when he
sells \$100 worth of pork at five cents
a pound he sells as much fertility as
he would if he sold \$360 worth of
cream. As a matter of fact, in
dairying, in the selling of butter or
cream very little fertility is re-
moved from the farm. It is esti-
mated that in selling a ton of but-
ter not more than 50 cents worth of
plant food is removed from the
farm and, if the butter was absolute-
ly clean and pure, there would be
none removed.

Dairying makes the farmer a
manufacturer. It always pays to
put the products you have for sale
in the best form. The manufactured
product represents the value of the
raw material plus the value of work
put upon it and a certain profit.
Dairying also enables the farmer to
pay cash for what he buys. His re-
turns come in regularly and his ex-
penses can be readily met. Many a
farmer becomes discouraged because
he was unable to keep up with the
running expense of his farm.

Dairying makes the farming at-
tractive. Other things being equal,
the dairy farm is neater, more sani-
tary, looks better to the passerby,
than the grain or stock farm. The
dairyman must be cleanly to make
his place attractive. This will be re-
flected in the farm and surroundings

as well as in the work he is trying
to do.

You should be a dairyman because
the business is both profitable and
interesting. The boy or girl who is
interested in the work that is being
done, will find less to draw him or
her away from home.

Any work loses its drudgery just
in proportion as it demands careful
thought and attention. It is drudg-
ery that drives people from the
country. If the farmers can keep
their children at home they will be
doing a great work for themselves,
their families and society in gen-
eral. For these reasons you should
be a dairyman. Do not think these
are all. There are as many more
as there are people. Every man has
his own individuality to consider,
and this alone will tell him why he
should be a dairyman.

HOLSTEIN TRANSFERS.

The following transfers of Hol-
steins in California are reported by
the Holstein Association:

BULLS—Astrea Butter Boy, L. A.
Hall to J. A. Edwards, Modesto.

COWS—Abuela 3d, C. W. Evans to
E. O. McClure, Modesto. Frances
Emily, James M. Rea to Dixon &
Chase, San Jose. Only a Pansy Blos-
som, James M. Rea to Wm. R. Dixon,
San Jose.

FILLS ITS PLACE.

A Texas subscriber who is connect-
ed with Griffing's Semi-tropic Nur-
series at Sarita, finds satisfaction in
the Cultivator and frankly says so in
the following letter:

I enclose \$1.00 to apply on sub-
scription. Permit me to say that of
all the papers that come to our office
none in my estimation, fills the place
that it attempts quite so well as the
Cultivator. I note with a good deal
of satisfaction and profit the im-
provements that are made from time
to time showing that you are on the
alert for our interests. The large
family of Cultivator readers are to be
congratulated on having such a val-
uable paper and such an efficient corps
of editors.

Now please don't think that we
have an "ax to grind," for I have not,
but I would like it very much if you
could find a space some time for the
little poem "Sunset at the Golden
Gate," appearing in the "Sunset"
magazine in 1903, I think—possibly
1904.—P. W. Arbenz, Santa, Texas.

We will try and secure "Sunset" at
the Golden Gate" for some later is-
sue.

"J. N. Neal, a Southern Michigan
farm owner, received last year \$1500
as half the income from his dairy
farm after all expenses had been
paid. On the farm 45-head of cows
were kept. One-third of the milk
was sold at wholesale at four cents
per quart and the other two-thirds
were retailed at five cents per quart.
The receipts from milk sold at whole-
sale and retail were, \$5500 and the re-
ceipts from hogs, calves and chick-
ens, \$500, making a total of \$6000.
The expenses were as follows: Help
and incidentals, \$2000; feed, \$1000;
total, \$3000. This left a balance of
\$3000 profit. Half of this went to
Mr. Neal and half to his tenant."

VALUABLE.

In remitting for another year to the
Cultivator, S. A. Stover, Kingsburg
says: "Your paper is very valuable
to every rancher whether he be on
big or little ranch."

**Because You
Need
The Money**

It's your business and if you do
attend to it, who will? You can
afford to keep cows for fun. That is
business, and, furthermore, it is
necessary. There is money in it.
Keeping if you go at it right, and it
sides there is more fun in going at
right than there is in staying wrong.

You need a Tubular Cream Sep-
arator because it will make money for
you; because it saves labor; because
it saves time; because it means all the
difference between cow profits and
cow losses.

Look into this matter; see what a
Tubular will do for you and buy one
because you need it.

Deciduous Fruit Culture

ADAPTATION OF VARIETIES TO CLIMATE.

WHEN we read of large areas of
land being planted to some
leading variety of fruit trees
we take it for granted that such va-
rieties as are planted are the particu-
lar ones that should be planted for
profit. This is often the case and
very often it is not. One variety may
grow to perfection in one place and
a short distance away may be en-
tirely unsatisfactory. This is strik-
ingly illustrated in the table grape
sections of the north. In those parts
where the land is rolling, the ridges
being a light brown, sandy soil and
the low land a clay soil, growers of
Tokay and Purple Cornichon grapes
have learned where to stop planting
one variety and commence planting
another. The Tokays maturing to
perfection on the ridge land where
the Cornichon does not and vice ver-
sa. One row of grapes may be To-
kays in the center and another va-
riety at each end. In another sec-
tion of the State will be found the
Tokay growing to perfection on the
lowlands.

When the true Smyrna fig was
first produced by Mr. Roeding at
Fresno, the general impression pre-
vailed that those figs could be pro-
duced on tens of thousands of acres
in that valley, and nearly every acre
produce them to perfection. It hap-
pens that such is not the case and
the boundaries of the Smyrna fig dis-
tricts of California are not yet de-
fined. When the Imperial country
came into prominence the opinion of
many was that it would open up
an unlimited area suitable to fig
culture, but later experience has
demonstrated that there is little evi-
dence that figs can be grown there
successfully, except a very early crop
of table figs.

There is nothing more important
that the grower can consider than
the subject of proper varieties for
his particular soil. Insects and dis-
ease are secondary considerations
compared with this subject.

Many prospective planters will ask,
how am I to know what varieties to
plant? If no one has demonstrated
what is the best variety in any par-
ticular district, it is up to the
pioneer to do so. When it is possi-
ble to identify similar conditions of
climate and soils in connection with
successful plantations in even widely
separated sections, it is safe to plant
like varieties. This, however, is not
always an easy matter. For in-
stance, one can stand in view of a
number of orchards in any citrus
belt that, under apparently identical
conditions of soil and climate,
produce widely different grades of
fruit, due sometimes to different
methods of handling, or frost condi-
tions.

Literature on the olive would in-
dicate that this fruit would be
ideally located in practically all
parts of Southern California. Prac-
tical results show that it is more at
home in the northern valleys, due
no doubt to a climate that is more
congenial to the plant at certain pe-
riods.—J. W. Mills.

IT'S PENNY WISE.

Policy to set out a good tree, cost-
ing good money and then let the sun
burn the bark or the rabbits gnaw
it when for \$1.00 an acre you can
get Yucca Tree Protectors that are
practically indestructible. Write for
free sample of the wrap. Yucca
Manufacturing Company, 1380 Willow
Street, Los Angeles.

RULES FOR APPLE HARVEST.

From the rules of the Hood River
Apple Growers' Union, we quote:

1. Pick all apples as soon as they
have attained the proper size, color
and maturity, and save loss from
dropping. In picking be careful not
to pull off fruit spurs or stems.
Your pickers, packers and wrappers
must not bruise apples by dropping
into the bucket or basket or in
transferring from the field box. Be
careful and do not allow pickers,
packers or wrappers to break off
stems of apples.

2. The Union will notify you all
by mail when a variety is to be
packed and how. Upon receipt of
such notice pick, wipe and have all
arrangements made for packers, as
follows: Packing house, boxes, paper,
packing table, nailing machine, nails,
etc. Notify the Union, when you
are advised a variety is sold, when
you will be ready for packers. Pack-
ers will be sent to growers in order
of notification.

3. The packing house should be
arranged to let in plenty of light, and
keep out as much wind as possible.
Provide sufficient lamp light for late
in the afternoon, as it gets dark
early.

4. Packing Table.—Each grower
should have tables for four packers.
Be sure and get one.

5. Paper.—See that you have
plenty on hand for your crop. Car-
load for sale at Union; price, cost
laid down.

6. Boxes.—Have sufficient number
on hand. Keep them dry. Do not
pack fancy fruit in dirty boxes.
Dirty boxes buyers will not receive.
Therefore, the Union will decline to
accept them.

7. Sorting.—Cull out all wormy,
scabby, scaly, bruised, misshapen or
otherwise imperfect apples. Packers,
in final sorting at prices agreed, will
not be required to cull out more than
eight boxes in 100 without extra pay.
Sort your apples into the standard or
special box, whatever they will most
likely pack into to the best advantage.
This will save a great deal of time.
Growers in sorting are requested to
put four-tier and larger in boxes by
themselves and all four and one-half
and five-tier in boxes together.

8. Wiping.—See that all apples are
properly wiped for the packers. In
piling boxes after sorting, put cleats
between, so apples won't bruise.

9. Apples on Packing Table.—
Growers will be expected to see that
the packing tables are kept properly
filled for packers.

10. Paper and Boxes Handy.—See
that empty boxes and paper are con-
veniently arranged for the packers.

11. Setting off Boxes.—Each pack-
er will be required to set off his own
box, and put on the lower left hand
corner of the end of the box with a
rubber stamp his packer's number.

12. Stenciling Box.—Each packer
will write on the end of the box the
number of apples contained in the
box. The grower or foreman will
stamp on the end of the box, in the
middle at the top, the number of ap-
ples contained in the box, and under-
neath the name of the variety. A
complete set of stamps for this pur-
pose will be carried by each foreman
of a gang.

13. Grower's Number.—Each grow-
er will be required to put on his
number with a rubber stamp in the
upper right hand corner of the end.
If you do not have a number, call at
the office and one will be presented
free. If you do not fully understand
the stamping of the boxes ask the
foreman of packers, or the manager
will explain.

14.—All stamping must be on one
end of the box.

15. Packers must pack apples so
that they will not be above the top
of the box on either end. Growers
will be allowed to refuse to nail a
box unless so packed. If absolutely
unavoidable in very large apples,
the grower will be sure to put on
cleats under the lid at both ends.

16. Piling and Loading.—Pile
your boxes, after being picked, on the

sides and load in the wagon the same
way.

17. Hauling.—Haul on springs,
and use a wagon cover to keep off
dust and rain.

18. All boxes should have four
nails on sides, tops and bottoms. A
great many boxes came in last year
burst. We, therefore, request you to
use five or six-penny cement-coated
nails, which are the only proper
nails to use.

19. We grow fancy fruit. Our
reputation and prices this year and in
the future depend on our pack. Do
all you can to assist the board of di-
rectors in carrying out their plans.
These requests are made by them for
your interest.

The Superlative Raspberry

Too much cannot be said in favor of the Superlative. It is a red, sweet berry three times as large as any other Raspberry, to my knowledge. It is a continuous cropper from May to November. I counted on one cane 472 berries of different sizes. Just think of a sweet raspberry as large as a Red Logan. Do you know what that means? It means for years to come heavy demand for fruit and plants. Every nurseryman will want a heavy supply. I received 5,000 plants from the introducer in Europe last Spring, and another 5,000 will arrive in November. I offer 2-year-old Plants now at 50c each, \$5.00 per 12, express paid. Going fast.

The Vegetable Garden

SCIENTIFIC GARDENING.

OUT AT the Packard place on Carillo street, beyond the railroad, on the western edge of the city, Monsieur A. Bussiere, agriculturist, a graduate of the National School of Agriculture of France, is engaging in the work of Luther Burbank.

For three years M. Bussiere has been experimenting, as Burbank did when he began, with potatoes. He claims success for his efforts in a potato which will produce heavier crops under ordinary soil conditions, is unaffected by frost, and may consequently be grown at all times of the year; will keep longer than the ordinary potato, and has a greater percentage of starch.

This potato is a French production, acclimatized to local conditions. The first seedlings were brought from Uruguay to France, about seven years ago. They were very small, probably no more than an inch in diameter, and very red and bitter.

It has attracted much attention in all parts of the continent and being introduced largely into cultivation. For the discoverer there has been a fortune.

M. Bussiere brought the first seedlings to Santa Barbara about three years ago, and began to experiment to acclimatize them. For damp soils he claims phenomenally large crops, 33 tons to the acre, ranging down to lower figures as the dryness of the soil increases.

A peculiarity of the potato is that it grows very close to the surface of the ground, so that it may be gathered without any digging, just as soon as any are large enough to be picked. The smaller ones are left in the hillock until they mature.

Ordinary soil serves very well for the growth, but the damper it is the better. Alkali land, which is generally damp, is the most suitable for the production of large crops. The quantity of starch obtained by analysis from potatoes grown on different soils is shown to be 16.5 per cent for very damp soil; 14.5 per cent damp soil; 13 per cent dry soil and 12.5 per cent for very dry soil. This is a much larger average percentage of starch than that obtained from the common varieties.

He is probably the first person in this State to undertake the growing of mushrooms as they are produced in France.

In the basement of the barn, a damp, dark place, are his mushroom beds. He has sent to France for the spawn, a sort of fertilized soil which contains the seeds of the mushrooms. The garden is very interesting. Along the entire length of the basement he has thrown up little mounds of rich fertilized earth, about a foot high and carefully rounded. Through these the spawn is mingled until the whole bed is covered with mushrooms. Thus he reproduces seed for new beds.

About two months after the seeds are scattered through the beds, the mushrooms begin to mature, and after that the mounds frequently present a white surface over their entire length. The largest are picked three and four times a week and sometimes daily.

They are of the finest quality and command fancy prices in the San Francisco and Los Angeles markets.

They are also put on sale locally. The demand is always greater than the supply, and M. Bussiere is usually adding to the number of mounds which produce their growth in the dark and dampness of the old barn.—Santa Barbara Independent.

BETTER THAN BONFIRES.

The woman who makes delicious little dishes out of the left overs of her refrigerator and contrives innumerable pretty little birthday Christmas gifts from scraps of ribbon and lace will rake up all leaves in back yard and set fire to them without once thinking that she is violating her boastful principles of the "I wish I could have a garden, this soil is so poor I can't raise anything on it," lamented one housemother.

"You can have a good one if you will try my plan," said the woman who knew. "Last year I had an empty barrel with a square opening in the bottom, turned upside down, the furthest corner of my back yard. It was really a sort of mite box. At the opening I dropped peapods, corn cobs and husks, tea and coffee grounds, banana peelings, in short everything in the way of vegetable refuse that was not sour or salt. Sometimes I threw in a little lime to make the heap molder more quickly. Grass clippings from the lawn were in once or twice a week and this time of year I hoarded every dead leaf for there isn't anything better to make a rich compost.

"When I came to plant my garden this spring I had a bushel or more of the stuff. You remember how the Indians taught the Pilgrim fathers to plant a herring in each hill of corn for a fertilizer? I put a trowel full of my compost in every hill of corn and melons and cucumbers and dropped it in the trenches where I sowed nasturtiums and four o'clocks and planted pansies. My flowers and vegetables were far ahead of any of my neighbors. I sprinkled top soil over the compost every time to keep the tiny roots from it, and as the plants grew they reached down into it and thrived like Jack's beanstalk." —Portland Oregonian.

ROSELLE OR JELLY PLANT.

California should grow more of that excellent jelly producer, roselle (Hibiscus sabdariffa). It produces well; is comparatively easy of culture and makes a fine jelly. With it all, it is ornamental and always of interest, because of its novelty. The writer has grown it for years, having secured the first seed from the Pomona Experiment Station—since discontinued—from that seed year to year reproduced it. It is somewhat hard to get started in the spring, and last spring almost the whole number of plants were wiped out by the cutworms. Less than a dozen plants were saved and all are being saved to provide seed for next year's start again.

It produces a heavy yield of fruit per acre, amounting to 6000 or 7000 pounds under average conditions. The plant will tolerate a reasonable amount of dry weather, but responds freely to the application of water and produces more heavily. The seed is sown about March and the plants reset in the field when about six or eight inches high, at distances about four by six feet if irrigation is to be practiced. In dry localities four feet by four feet will be sufficient.

Ginseng Culture Successful in California

One acre worth \$25,000. You can grow such a crop, and we can tell you just how to do it. We have 60,000 roots growing thriftily in our garden near Santa Cruz. You need California grown Ginseng to begin with. Our stock is limited. We shall not sell enough to cripple our own garden. Write us for information regarding conditions, space required, price of seed and roots, etc.

The Ornamental Garden

THE CHRYSANTHEMUM.

IN GIVING directions for the care of chrysanthemums from September first till their blooming period, it is supposed they have received good care up to this date.

There are different methods of propagating the plants—one, by cuttings, which is the proper method, and by division of roots, which is wrong, and will not produce near such good results. Taking it for granted you have secured the best plants. These should now be from two feet to four feet tall. There are two methods to be considered—one to produce show flowers, and the other to produce quantity of bloom; and while the care is the same the culture is directly opposite. To produce show flowers the plant should be of single stem, all side branches and suckers should be carefully removed while small, and the plant given the greatest care; staking should be postponed as long as possible and stocky growth induced, but if the plant is weak it should be staked.

The bamboo stake is by far the best, being strong and durable, and above all being small and unobstructive. These can be secured from seedmen who handle such supplies. As soon as side buds commence to appear they should be removed and all growth allowed to one stem and terminal flower bud, leaving but two at most, and ultimately selecting the best of these, removing the weakest one. As soon as the flower begins to open, a light covering of muslin should be drawn over the plants to screen them from the hot sun and winds. Cut off the stake a few inches below the bud; carefully and strongly tie top to avoid whipping. A well grown flower will measure according to variety from six to twelve inches in diameter and is accordingly quite heavy and will easily be broken or injured.

The common method of culture is the desire for quantity of flowers with no regard to size. These are allowed to branch and sucker and are grown in clumps, but should be gathered together and tied up to a stake. To improve size of flower reduce the number of stems and trim off some of the side shoots and encourage "terminal" blooming. That is, remove part of the bloom buds from side of shoot.

Fertilizers.

The chrysanthemum is a heavy feeder and strong fertilizer can be applied in large quantities. This should be well attended to at the planting and continued, as they require it through their growth. On heavy, stiff soil use a heavy mulch of stable manure. Commercial fertilizer will do well if on light soil. In the Eastern States, and especially in parts of Europe, Clay's fertilizer is almost exclusively used about one month before the buds begin to open. This is given to the plant in considerable quantities, and is considered the ideal fertilizer for them, but so far it has never been used on this coast. Strong liquid fertilizers are also applied, especially to plants grown in pots.

The utmost importance, after the flower begins to open, is to protect it from the wind, rain and sun, as the wind will whip and destroy as well as the rain, while the sun will bleach them out. Muslin is probably the

best article to use for this covering. It well repays one for the little trouble and expense. These items should be taken into consideration when planting your bed next season to so arrange the bed as to be easily covered and protected.

Some early varieties are now blossoming, while many others are only in small bud and will not be out until towards the holidays.—O. M. Morris, of the Morris & Snow Seed Co.

A GARDEN FOR PLEASURE.

Give your garden a chance to prove what can be accomplished there. Start in time to plan for the arrangement of the little garden spot, choosing the flowers which seem best adapted to it, and prepare the ground for the reception of seeds. If the space is large, have it dug for you, though if possible, take the time outdoors and accomplish the work yourself. You will enjoy it and it will pay you a thousand times in health and strength.

Do not try elaborate designs, for it will mean enlarged expense, for taking more time, and the chances are ten to one that it will disappoint you after all. Instead make the flower arrangements as simple as possible, blending two or three pretty flowers and vines and giving them plenty of room to grow and spread themselves. This will aid in counterbalancing the disadvantages of shade and poor soil. Give your back yard garden a fair chance and see if it does not repay all your care of it, by filling your summer days with brightness.

GROW FLOWERS.

It is a surprise to me to see how many, young and old, come to me for flowers. They want them for church socials, for decorations, for weddings, for the cemetery to place on the graves of the dear friends that have gone before, and for many other purposes. They all get flowers as long as I have them to give. Yet how easy it is to grow flowers, but how few there are who do so, compared with the whole number who might do it.

There is nothing which does so much to please the eye, and lends so much grace to the home, as flowers and vines. So many stop to look at my few flowers, and ask for a rose, a dahlia, a crape myrtle or some other of my floral pets, and they never ask in vain, so long as there is a bloom. I take as much pleasure in giving flowers as I do in growing them. None go away empty handed. Young and old, rich and poor, all have a happy smile for the old man as they say, "Thank you."

Today, three little ones came and asked me for some flowers for the decoration of their church for Monday evening; they said there was to be a concert and that they wanted just a few of my pretty flowers to help make their church look bright. They will get the flowers, a nice bunch, at that. It is one of the pleasures of my life to make children happy, and it can be done at so little cost to the growers.

I remember reading a verse like this: "As ye have done it unto one of the least of these, my brethren, ye have done it unto me."

Why do not more of the people raise a few flowers, and have them to give away to those who do not know how, or lack the inclination to do so? Try it. Make your home more attractive, and some sick or well friend more happy. Try it and see if you are not little nearer Heaven than you were last year.—The Old Man That Loves Flowers, In Florida Agriculturist.

Malthoid Roofing

Is the highest grade ready to lay roofing manufactured. It is suitable for covering warehouses, mills, barns, sheds, business blocks, office buildings, residences, etc.

The standard by which all ready roofing must be compared is Malthoid—there is no

"just as good kind"

on the market.

SENSELESS FINANCIAL AGITATION.

There are premonitions of disturbance in the financial conditions of the country. Just why, no one seems to know, for never in our history have times been more promising. The crops in the Middle West are record breakers and money is cheap there, except, possibly, in localities where the corn crop has been caught by early frost, as in Ohio.

But there are pessimists and dissatisfied parties who seem bent on bringing on a financial crisis, if such a thing were possible, and these pessimists and disturbers are composed of Wall street gamblers, sour politicians and litigants who have come under the heavy hand of the law for violation of the Elkins National statutes. To this class is added what is known as the promotive real estate interest, which has been denied credit at the banks for further wildcat speculations. During the past four months there seems to have been an effort on the part of a good many real estate speculators to systematically cry down existing prosperity, and the endeavor to create the impression that there really exists a money panic in the country, or that we are on the verge of one. So far as these speculators are concerned, there probably is a panic, for scores of them have gone into senseless speculations, buying and cutting up thousands of acres of farm lands into subdivisions, which are so remote from business centers that they will not be needed for homes for the next ten years.

These promoters have done the country immeasurable damage. They have cut profitable farms into unprofitable town lots; they have produced fictitious values based on speculative possibilities; they have tied up the money of the labor-

ing classes in lots and in subdivision interests, and rendered these people hard pressed to meet their obligations. In short, they have over-boomed, over-subdivided, over-calculated the substantial growth of the territory surrounding the large cities of the country, until the "boom," becoming top heavy, is leaning over.

It is no wonder the banks of the country have called halt on lending money for wildcat speculations. They ought to have done so two years ago. They would have rendered a lasting service to the business interests of the whole community had they done so.

But all the schemes of Standard oil, and all the endeavors of land cinched corporations, to bring on a financial panic for revenge against the government and the banks, will prove futile.

Why?

Because there is solid prosperity throughout the United States. Legitimate business was never more secure. Every business man, who is doing legitimate trade can borrow all the money he wants in his business if he has the security behind him.

Every farmer is making money who is working intelligently and industriously. As a class, the agriculturists are richer today and making more money in 1907 than ever, and it goes without saying, when the farmers are prosperous there are good times, and when times are good there can be no general panic.

So far speculators and stock gamblers are concerned, no one cares whether they win or lose, their operations do not effect the general prosperity of the country, and the sooner they are brought to a condition of honest toil the better. Not only for their own sakes, but for the sake of common honesty as well.

No, there will be no general panic. There may be and there ought to be, a curtailing of promotive schemes without foundation in them, but so far as legitimate business goes, we shall see continued, steady progress, at least as long as the farmers continue to grow richer with each succeeding year. Agriculture is the basis of all our wealth anyway, and so long as we promote agriculture we shall be secure against the assaults of stock gamblers or pernicious politicians seeking disasters for personal benefit or revenge.

When Ex-Secretary Gage of the Treasury was in Los Angeles some time ago, he was interviewed by a newspaper reporter and one of the questions propounded was: "Secretary, will we have hard times soon, and if so, what will cause it?" To which he instantly answered with some spirit: "No sir, we will not have hard times soon, but if the condition should come it will be caused by just such fool questions as you are now asking me."

In other words, the everlasting discussion of hard times brings hard times. The hopeful forging ahead of all business lines indicates that the "fool question" isn't receiving very serious consideration.

FRIENDLY BIRDS AND INSECTS

If the introduction of ornithology into the public schools as an applied science will have the effect of teaching children the value of birds and insects to the garden and orchard, the sooner it comes the better.

In some of the High Schools in California we note the introduction of ornithology and approve of it.

Probably the best authority on birds and insects is Prof. Mason. In one of his articles he treats of friendly birds and insects as they relate to the garden and he teaches us that we should treat these intruders with kindness, rather than abuse them for the good they do. He insists that we should learn to distinguish between foes and friends in the garden and, if necessary, the children should be taught early the difference between insects and birds that do harm to plants and those that do good. Snakes, toads and lizards, instead of being injurious to plants are always invaluable in keeping down insects. Snakes may be repulsive in appearance, and poisonous ones very dangerous, but the ordinary ground snakes will not hurt one, and they will keep down mice, bugs and insects as nothing else can. As a rule, the noxious insects are in the greatest numbers in our gardens, and hence toads, lizards and snakes

that eat all that comes near them destroy more the foes than friends. "I should never think of killing one of these creatures in the garden," said Mr. Mason, "but would be inclined to protect them, and even to import them into the garden." "I have seen a small gray lizard clean the worms from a field of cabbages as fast as they could multiply. Attracted by the fat the lizard returned every day, and he would make trips up and down the rows of cabbages until a worm could be found."

A few toads in hotbeds and cold frames are inestimable value. They will keep down all insects that begin to show themselves, finding them under leaves and stalks that hide them from the ordinary observer. In Paris toads are regularly caught and sold to gardeners for insect hunting in their greenhouses. And yet many boys and older people destroy them ruthlessly as soon as they discover them in the garden. The toad will eat cutworms by the wholesale if they can find them, and have seen them devour potato bugs in great numbers when deprived of more palatable food.

But we have also friends among insects, and it is well to bear in mind that they can do much good for us. The so-called lace-wing insects are nearly all friendly to us. They live on other insects, and do not eat any part of the plant. A few can be turned loose in a greenhouse they will destroy all insects other than those of their own class. In this class are included the antlion aphidions and dragon flies. For every one of these we kill we must expect a dozen enemies to spring into active existence that must be destroyed by spraying.

All members of the hostile family are insect eaters, and they go around the gardens in search of their prey continually. They will attack large grubs and other insects, as well as the very small plant lice that hide behind the leaves. These beetles must be distinguished from others that destroy the plants. The large robber flies are all great friends in the garden, and they will attack all kinds of grubs and insects. They are particularly eager to destroy aphids.

So the professor goes on through a long list of birds and insects which he avers are the best friends the lawn and garden has. We all know the mocking bird and the brown Betty and many other species of our native birds are wonderful worm hunters. They swoop down on a new mown lawn and clean it of worms as soon as the mower has gone over it.

We should learn early to distinguish between the friends and enemies of our lawn and garden, and the best way to do this is to teach the children in the public schools what birds and insects and reptiles to protect.

THE WEARY TRAMP.

California is the ideal winter country for the hobo. Even now he is wending his way from the inclement Middle West to the sunlit clime of the Golden State. Every winter we have an influx of this undesirable class.

The tramp hates two things, work and soap, and it is a question which of the two he dislikes most. If we would be rid of the tramp, we could do so by putting him to work. Making good roads is especially his forte, and if anything will do the business of clearing the State of this nasty element, work will. California has an unlimited amount of roads to make and help is scarce; why not utilize this tourist class for improving the streets in town and the county? Instead of merely locking tramps in the calaboose, where they get board and lodging free of charge, put them at work in gangs on the roads. The money appropriated by the State will not be sufficient to make all the roads that have been mapped out and a few days of good hard work extracted from every tramp that happens along will go a long way towards getting the highways into shape. It will also have the effect of making the "walking tourists" give the State wide berth in their future peregrinations. If county sheriffs and their deputies and city marshals would go out into the highways and byways and corral all the tramps they can find, our roads will be improved and at the same time the communities will be rid of an undesirable class. The experiment has been tried in several States with excellent results.

Agricultural Notes of the Pacific Coast

Northern California

Apple blight is ruining many orchards near Red Bluff.

Hop growers near Redding are holding for better prices.

The pre-cooling plant at Roseville is said to be working admirably.

Walnut trees near Grass valley indicate that to be a valuable crop for that section.

One Tokay grape grower near Lodi receives \$50 an acre for Tokays from his two-year-old cuttings.

A recent meeting of the Petaluma Grange received reports from the delegates at the State Grange of San Jose.

At an auction of sheep at Dixon recently the ewes averaged \$7.85 per head. Stock was not thoroughbreds but simply grade stock.

A lemon tree at Lodi, twenty-seven years old, is producing about two thousand lemons on an average a year. Fruit is exceptionally fine.

The Sacramento valley papers do not take kindly to the suggestion of calling the Sacramento and San Joaquin valleys the California valley.

District attorney of Alameda county is evoking the Cartwright law to break up the combination of dairymen supplying milk to that section.

Over twenty-six hundred carloads of grapes have passed through Sacramento for the east this year. This is largely in excess of the '06 crop.

The Ukiah Creamery Association has agreed upon plans for a creamery building, and construction has begun. Five hundred cows will supply the milk.

The Ukiah Times says that the local hop market is somewhat better than earlier in the season, and a few sales have sold close to the ten cent line.

Of California's fifty-seven counties, Alpine, Del Norte, San Francisco, Mono, Sierra and Trinity are the only ones which are not fruit-producing counties.

Members of the Drainage Committee of the Sacramento drainage district recently took a trip of inspection down the river from Colusa to Sacramento.

The Alameda Sugar Co. has leased twelve hundred acres of land in Yolo county and the expectation is ultimately a new sugar factory will be established there.

There were thirty-five hundred acres planted to sugar beets at Hamilton city this season, which it is hoped will be increased to ten thousand acres next year.

An experiment is being tried in storing peaches in Marysville. They have already been in the cold room four weeks and are as plump and nice appearing as ever.

Alden Anderson, president of the California Fruit Distributors' Association, says that fresh, deciduous fruits will bring to the northern part of the State over \$10,000,000 this year.

The entire town of Sam'l O'Posen was sold for taxes recently and will now be used for grazing land. This is a town site plotted on extremely poor land and the deeds to land given away with each ticket to a certain theater in San Francisco. Of course, the holders to the deeds never paid taxes.

Central California

San Jose offers five cents bounty on every rat.

Fresno claims good results from the recent raisin festival.

Lemon Cove is planning to raise bullfrogs for the market.

Pajaro valley people held their apple fair at Watsonville last week.

Modesto is hoping for the establishment of a cannery in the near future.

Nearly all raisins were stored or well under cover before the recent storms.

Dried peaches in the San Joaquin valley are nearly all in the hands of packers.

An effort is being made to secure the establishment of a fish hatchery in Tulare county.

A two hundred-acre prune orchard near Visalia yielded five hundred tons of cured product.

Sugar beet contracts are being signed up by many growers in the neighborhood of Corcoran.

Packers endeavoring to buy pears near Fresno have been unable to get any material quantity.

Some people in Tulare county maintain that macadamizing is preferable to oiling, even considering its additional cost.

Railroad companies are still unable to supply cars for transporting hay and other products from the San Joaquin valley.

A number of Chinese pheasants have been introduced into Eastern Tulare county and it is hoped they will become acclimated.

The dumping of raisin seeds from the packing houses in Fresno into the sewer has caused trouble with clogging of the main outfall.

The honey season in the neighborhood of Fresno is nearly over and there are now only a few cars to forward. Prices have been very good.

Many dairymen in the neighborhood of Hanford are putting in testing appliances for determining the performances of each cow in the dairy.

The directors of the Kings County Poultry, Pigeon & Pet Stock Association held its meeting last week to make plans for the show to be held November 26th to 30th.

It has been found that the demand for dried fruits in Eastern markets has, to a certain extent, been unfavorably influenced by the sulphur agitation earlier in the season.

Notice is being published in the matter of the formation of the reclamation district in Fresno county, to be known as Crescent Reclamation District. It will reclaim land along the Kings river.

"Rainmaker" Hatfield, at Los Banos, wants to contract at three cents per acre for one hundred thousand acres to supply twelve inches of rain on the West side. It is reported that he is finding some "e-z-marks."

California shipped ninety-eight cars of cherries this season as against one hundred and forty-nine last year, but against that we shipped seventy cars of green apricots as against sixteen cars last year.

Southern California

Oxnard has a new veterinary hospital.

Chili peppers are being shipped in car lots from Garden Grove.

The Delhi Creamery at Santa Ana was destroyed by fire last week.

More shed room is being built by the Imperial valley melon raisers.

California Vegetable Union shipped two carloads of tomatoes last week.

A cloudburst which hit Redlands last week caused some little damage.

Bee men of Imperial Valley will meet at El Centro on December 26th.

The last car of San Diego county honey has been shipped for this season.

Lompoc has just shipped twenty carloads of mustard seed valued at \$25,000.

A bunch of Texas colonists arrived at El Centro, Imperial Valley, last week.

A cannery to employ five hundred hands is under construction for Riverside.

A West Riverside dairyman has established a foot-power milking machine.

Next year's Imperial valley crop of cantaloupes will be twice that of last year.

Brawley is preparing for its institute of December 5th, with a good program.

Eleven tons of beets to the acre is the average in the Huntington Beach beet section.

Riverside county is buying a new rock crusher for aiding in building its new roads.

The first snow of the season is now visible on the mountain tops of the higher ranges.

Imperial valley has just received a carload of beets shipped in from near Escondido.

The crop of beans in the lower lands west of Santa Ana, is said to be exceptionally good this year.

Various counties in the southern part of the State are combining to fight the dustless roads oil patent.

Rialto wine grape growers have shipped most of their grapes this season to the Cucamonga winery.

A Pomona seed man reports an unusual sale of field peas for green manuring during the past season.

The health officer at Riverside has reported the finding of formaldehyde in the cream delivered at that city.

The high price of alfalfa seed has not discouraged the Imperial planters and much acreage will be sown this year.

Sawtelle, near Los Angeles, has nearly one hundred and fifty acres of chili peppers nearly ready for harvest.

Perris claims a grape vine which was a cutting this spring and shows a growth of twenty-five feet for this year.

Nearly four hundred cars of hay and grain and two hundred cars of alfalfa will have been shipped from Hemet this season.

Manager Jones of the American Beet Sugar Co., at Alamitos, says that the average sugar content of beets for that section has been sixteen per cent.

The Coast

Eastern dairymen are heading for Colorado.

The Willamette Valley fair will be held in Portland November 14th to 16th.

Oregon State Poultry Association will hold its annual show at Portland January 8th to 14th.

The best exhibit of Utah's products ever made is the verdict regarding the recent Utah fair.

Clover growers in Yamhill county, Oregon, are getting twelve to fifteen cents per pound for clover seed.

The Coos Bay country is producing cranberries which are now quoted in San Francisco at \$3.50 to \$4.00 per box.

The Hawaiian Islands have an annual yield of fifty-seven thousand tons of sugar produced from twenty-three thousand acres of land.

Owing to the failure of railroads to furnish cars, a large packing company at Tacoma is canceling contracts for purchases of cattle.

The Idaho Experiment Station is at work breeding a strain or variety of sweet corn which will mature seed in Northern Idaho by September 10.

Larger shipments of pineapples, Avocado pears and bananas were made to the coast from Hawaii this season than any season heretofore.

The Oregon Agriculturist is appealing for a revival of dairy butter, claiming the creameries are putting up a lower grade product than they should.

The Agricultural College at Colorado is to establish a new feature in a farmer's institute train which is to hold institutes along the line of the Santa Fé railway.

"The largest exhibition of horses ever made this side of Chicago" is the claim of the Oregonian for the horse show to be made at Portland, November 7th, 8th and 9th.

Judge Wolverton, of the United States District Court of Portland, Oregon, handed down an opinion which sweeps away restrictions upon the admission of the Japanese.

Twisp, Washington, is about to revive an old irrigation scheme which formerly failed which it is now claimed will bring thousand of acres into more profitable production.

Cotton in southwestern Texas is said to be in extremely poor condition, running only about a quarter bale to the acre. The damage was caused by the cotton boll weevil.

The Oregon Agriculturist says that the output of prunes from that State will yield to the producers close on to \$1,200,000 instead of \$500,000, which has been claimed by some others.

The usual belief that tomatoes could not be produced in Puget Sound country, is blasted by the production this season at Sumner, Washington, of fine crops of tomatoes which have proven very profitable to their owner.

Three hundred thousand bushels of wheat will be marketed at Steptoe, Washington, this season. The crush to get the grain delivered is often such that farmers have to leave their wagons standing over night in line for delivery next morning.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledge standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co., Indiana and Yolo Sts., San Francisco, Cal.

Also Pioneer Manufacturers of High Grade Fertilizers.

Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yards

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

VARIOUS TOPICS.

IN ANOTHER column we print a letter from one of our readers who wants information along lines of general poultry culture. One of the questions, as to the number of birds one man can take care of, can hardly be answered intelligently. For the writer to say that one could not take care of 500 or 1000 birds as it should be done, would be assuming a good deal. In other words, it will depend entirely on the man behind and arrangements of houses, yards, etc. There are poultry ranches in this State where one man takes care of more than this number and gives them the proper attention.

Speaking in an offhand way, we would say that a man to care for a dairy of ten cows and from 500 to 1000 head of poultry, would have to work from ten to fourteen hours a day or neglect either his dairy or his poultry. However, if a man is a strong, willing, hardworking and thinking man, he can accomplish a great deal along these lines.

We know of no business that calls for longer hours and more work than the dairy business, and to make a success of the poultry business, one has to give it close application. So in the last analysis we will say, start in a small way and grow to your limit, whether it be 100 or 1000 head.

Open Front Houses.

The open front house when faced so the wind will not blow directly into it, is good for California; we prefer it with a burlap curtain to let down in damp or foggy weather.

The writer had the privilege of visiting a ranch last week where over 600 Black Minorca hens were kept. The houses on this ranch were made of canvas, with dirt floors. Separate houses were used for roosting and laying. We were told that this style of house was used the year around with good results. That the net profit was over \$2.00 per hen per year. The writer looked the flock over very carefully and failed to see one sick bird, which certainly speaks well for the treatment they receive.

Leghorns and Orpingtons.

For eggs and roasters, we would say that in selection of the above breeds you acted wisely as both are good; our advice is always to select the breed you like best, as all have their good points.

There certainly is a good market here for both eggs and broilers or roasters; we could write an article on preparing and marketing poultry, for we feel that this is a branch of the industry that can be improved a great deal and certainly needs more attention than it is getting.

Capons are also in good demand, but only large, heavy, fat ones are wanted. A thin capon is no better than an old rooster, but fat, prime capons command the best prices the year around and dealers in all large cities complain that they cannot supply the demand.

Private Trade Best.

The best and most satisfactory way of marketing eggs and poultry is to private trade. Arrangements can be made with the large hotels and res-

taurants whereby you can ship them each day, thus insuring a ready market for your product and at good prices. This, of course, is for dressed poultry.

Swift & Co.—the largest poultry dealers in the world—pack their stock in boxes and grade it as follows:

Weight per dozen.
Large broilers26 to 30 pounds.
Small broilers20 to 25 pounds.
Small fryers31 to 36 pounds.
Large fryers37 to 42 pounds.
Medium roasters43 to 48 pounds.
Large roasters60 pounds and over.

For private trade direct to families, some poultrymen pack the birds in pasteboard boxes, each holding one bird.

If you ship to commissioners, you should be taken to investigate and reliability, as a dangerous number of concerns are in the business to fleece everybody. This practice is so common that the United States government has issued this advice to shippers:

As to Commission Houses.

"Beware of being tempted by higher market quotations than are sent out by well established dealers. High quotations are the favorite bait of the impostor."

"There is also a legal point that is well to bear in mind. In most, if not all States when a commission merchant receives goods on consignment he becomes the shipper's agent, and any attempt to defraud his principal is punishable by fine or imprisonment. Not so if he buys goods outright, agreeing to pay for them at a stated price. In the latter case the shipper's only recourse if he fails to receive the contract price is a civil suit, resulting in a judgment generally worth no more than the paper it is written on. For this reason, dishonest merchants frequently offer to buy outright. Too great care cannot be exercised in these matters. When a direct sale is made, except to a well-known house of good reputation, the safest method of procedure is for the shipper to consign the goods to his own order, making the draft through bank or express company and attaching it to the bill of lading from the railroad company, properly indorsed. The bank or express company will then present the draft and surrender the bill of lading only on payment, so that the commission merchant cannot obtain the goods until he has paid for them." Five cents on the dollar is the usual commission for selling poultry.

AN INTERESTING LETTER.

In your August number you asked your readers to write of their methods of caring for poultry, and as I have had some success, will try and help some who have not yet learned by experience how to make poultry pay, writes Mrs. West of Gardena, in Commercial Poultry. I keep from 200 to 400 chickens of all kinds. We live on a ten-acre place and they have the run of the place. If I want flowers or garden, that is fenced, but never the hens. I have been in California 23 years and have raised thousands of chickens in that time.

Some Pests.

Of all the pests to contend with

here, the mites are the very worst, or they get a start and take you by storm. But years ago I wondered why I could not scald them as we did red bugs in the East, and since then I can manage them; but you must not have your roosts nailed to the wall of the hen house, or so a hen can come in contact with the wall, for the mites will leave the chickens in the morning and hide in the hen house during the day and be ready for their work at night. Our roosts are planed two-inch slats, resting on stout saw-horses. I can take them all outside when I go to clean the house and scald them, and if the nest box gets infested with mites, just use acid, and clean with hot water. It will penetrate every crack or nail-hole and is better than any spray or wash that is made and costs only a little work. Go into the house in the early morning and turn over the roosts and see the mites hiding, filled with blood. Some morning I will take a quart of boiling water and go in the hen house and put the rest to sleep for good.

Pure Water.

One thing that must be looked after is clean, cold drinking water. I use the best granite pans, for I am afraid of rusty tin pans. I keep a whisk room hanging near the hydrant, and I fill a pan ten times a day it has to be cleaned with the broom each time. I never give any medicine in drinking water, for the fowls will suffer for water before they will drink water with medicine in it. How would we like to be compelled to drink water with medicine in it when we wanted a drink? Chickens drink more accordingly than do people. If you don't believe it, just watch them. I have to give medicine, I give it in milk or mash, but never in the water. I have been at places and seen the drinking water for chickens just red with copperas.

Good Tonic.

The only medicine I ever give, and have not had a drop of that on the place for two years, is Douglas' mixture. It is the best tonic made, but don't give it all the time. Use one pound of copperas to one gallon of hot water, and add one ounce of sulphuric acid. Keep in a stone jug or glass jars and use one teaspoon to a quart of milk or bran mash, and give no more than three times a week. I never keep geese or ducks with my chickens, for they get the drinking water so filthy, and this is the main cause of disease. I keep oyster shell, also granite, on hand all the time and break up every bit of glass and crockery for the chickens, and don't think it will kill them, as a woman in Los Angeles told me. She said she knew - someone had poisoned her hens, for they had broken glass in their gizzards. All pearings or vegetables are washed and boiled and given to the chickens. I keep a pail in the kitchen and all rinsings from the dishes and scraps are put in that, and then with a pinch of salt and mixed with bran, it makes a change for the chickens, and they like variety as well as we do. Now they are having a treat every day, for we are having lots of melons and they get their share.

Nice Profit.

This letter is getting rather long, but when I tell you that I have made over \$500 a year on my hens, I think it is worth writing about. This year I expect to make \$800 or \$900. I do my own work and have lots of time to read, and belong to a few societies,

and have time to go to the city to a good play or concert. I often wonder when I go in the large stores and see the women and girls standing all day, how much more they could make if they would keep chickens and take care of them. Why, if I wanted a sewing machine or an organ or even a piano, I would just get some hens and make them pay, and if I want ten or fifty dollars, I don't have to beg for it, as some women claim they do. For over three months this spring my hens laid 15 dozen eggs a day, and I was getting 20 cents per dozen at the door.

We always buy our grain by the ton. We raise our own corn, but I feed mostly wheat and Egyptian corn with bran mash occasionally. I never feed blood or meat meal. In the winter I get up early some mornings and make a hot bran mash and put in a little cayenne pepper, just as you would season your soup, and it is worth the work to hear them sing. I never use the dry mash. I don't think I would like to eat dry bran; in fact, I try to treat my chickens as I would like to be treated. Now, Mr. Editor, I know this is a long letter, but I hope it will encourage more to give better care to their fowls, for there is money in it if you take care of them.

HINTS FOR POULTRY.

It is one of the worst crimes of man, at least it appears so to me, to be cruel to dumb creatures, and yet it is a very common fault. I think some of the worst cases of cruelty to animals occur in the poultry business, especially in the city, where the fowls are compelled to be confined.

There is that small run with fifty or one hundred chickens in it. The owner thinks to get rich next winter with eggs laid by his early hatched pullets or by his early broilers. He provides no shade, no green food, and not a quarter enough water for his flock, yet he will expect to get winter eggs and if he doesn't will blame the breed and next year try another. The only thing his chicks have enough of is lice. With these his flock is well supplied and yet he grumbles when his chicks die off like poisoned rats.

City poultry raiser, put away your pipe and that dime novel one hour earlier each night, go to bed, and arise one hour earlier the next morning. Spend every minute of that extra hour on your poultry and notice the result.

Poultry of all ages should be greased or powdered at least once a week. One can not be too free with the lice powder. I had a hen only this week that apparently went crazy when I was feeding her. She tried to stand on her head and did all manner of crazy stunts. I immediately separated her from the rest of the flock. She breathed hard and her head turned a deep purple in color. I examined her body carefully and found many lice. I covered her with a good insect powder. Having previously lost fowls with this same trouble, I put some of the powder in her ears and in a short time she was much better, but very weak. She is improving fast. Although I had dusted her with powder regularly lice would have killed her if I had not been careful. This shows the importance of exterminating lice from your premises.

Another common fault in city poultry raising is not feeding the birds enough. They should have all they will eat, none to be left.

Inbreeding is another dangerous fault. Introduce new blood into your flock each year or two years at the

50 Cent Eggs

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

outside. Not long ago I heard a man say that he was going to give up a certain breed he had. I asked him "Why?" Well, his answer was something like this: "I have bred this variety four years and each year they get smaller. That is why."

Summary: Avoid crowding. Provide shade, green food and plenty of water. Remember that lice are your worst enemy and cut down your profits. Feed the fowls all they will eat. Do not forget to introduce new blood into your flock each year as inbreeding is dangerous.—H. L. Cook, American Poultry Journal.

AROUND THE YARDS.

First quality means "top prices."

* * *

Make a reputation for your ranch.

* * *

Look after the small things now and save trouble later.

* * *

Indian Games and Orpington crosses are good for capons.

* * *

The field of poultry culture is a good one if you are made of the right stuff.

* * *

If you are thinking of embarking in the tempestuous sea of poultry culture, think twice before you start, and then only go in knee deep.

* * *

Cold rains will soon begin, and unless we have arranged for our fowls and provided comfortable houses, we are sure to have trouble with colds, and possibly roup.

* * *

It is presumed that every place has been thoroughly cleaned and white-washed before this; if not, there is no time to lose.

* * *

Look after all leaks in the roof and stop them at once. Bank up the ground around the house and grade up the walks, so that when winter weather comes the hens will not be compelled to wade in mud to get to the house.

* * *

Success in the poultry business is not in making no mistakes, for the best of us make mistakes, but in not making the same mistakes over and over again.

* * *

Santa Ana poultry breeders have organized a poultry association and will hold a poultry show November 26-27-28.

* * *

Various Questions.

Kindly answer the appended questions, and greatly oblige a reader, who, before he began to read the Cultivator last May, thought he knew something about poultry, and the profitable management of the business.

On our Eastern farm the poultry (where I was born and raised) received but scant attention, outside of the first few months of summer, when the hatching business was in full blast. But I observe by reading and talking with those who know, that the "let them take care of themselves" method is obsolete in this "neck of the woods." Now here are my questions:

Can I successfully run a ten-cow dairy on twenty acres of ground, doing my own work, and give sufficient attention to five hundred or a thousand layers to justify successful results?

Are hen houses with the front or south side open, justifiable in this climate?

Can coal tar, as an inside painting, be successfully used against vermin, and would it be detrimental to the health of the hens?

I intend to try a laying breed, and also a meat breed; White Leghorns and Buff Orpingtons are my preference, is that good judgment?

Is there a good market here for what is known in the East as "Roasters." Usually caponized roosters; al-

lowed to merely mature and the speedily fattened. Are the Buff Orpingtons as good a chicken for the purpose as the Rocks?

Can I realize a better price in dressing my bird, than by taking the prices, and can I get as fair a treatment from the commission men, shipping direct to them?

Give the address of the State Poultry Farm, also State Dairy Farm?

The Cultivator is indispensable to any one engaged in tillage of the soil, in any of its numerous phases.—Joseph D. Wiggins, Laton.

See leading article in this department.

* * *

Broiler Feed.

How large is a broiler, in chickens and guineas?

What would feed Black Minorcas for eggs, that have free range. They have milk, all they will eat, green alfalfa, wild sunflower seeds and what bugs they can find on forty acres. They are fed at night; corn and some meat scraps from table; have oyster shells.

I have about 100 young pullets which I wish to make lay. F. E. E.

The size of broilers is given in the leading article of this issue.

Your pullets ought to lay on the ration they are getting, if they don't lay soon, you might get a good food and feed dry in hoppers, giving them free range on alfalfa also.

* * *

Moulting Food.

Should the feed of laying hens be the same while moulting as while laying. If to be changed, what is best when moulting? T. G. E. Gray.

Hens that are moulting should be fed a good moulting food, we don't mean a stimulant, but a well balanced ration. These foods can be bought, as a rule, cheaper than can be mixed at home.

* * *

Ticks.

Please tell me how I may get rid of ticks in the hen houses. They hide in cracks in daytime and come out at night to suck blood from the fowls.—A. L. B., Phoenix.

Spray with a good liquid lice killer, taking care to get it well into cracks and places where ticks hide. After about a week, repeat the operation to kill any that might have escaped.

* * *

Yards.

I have a piece of ground 40x200, and want to keep a few chickens. Would like to divide in 5 yards—(40x40 each.) How many can I keep in each yard and what the house?—Easterner.

We would keep 25 hens in a yard 40x40; and a house should be 6x8 ft. We know of a ranch where the yards are 25x48 feet, and houses are 4x6 ft. in these yards are 20 hens, which seem to do well, but we believe the house should be larger than 4x6 ft. for 20 adult birds, especially of the larger birds.

IT BROKE.

"Freddy, you shouldn't laugh out loud in the schoolroom," exclaimed the teacher.

"I didn't mean to do it," apologized Freddy. "I was smiling, when all of a sudden the smile busted."—Harp-er's Weekly.

BIG AS CART WHEELS.

I herewith enclose P. O. order for a renewal of my subscription to the Cultivator. Dollars are as big as cart wheels, but will have to have the Cultivator just the same.—Ransom Jonah, Watsonville.

ON TIME.

Better lose a minute being ahead of time than to lose a day by being behind time.

Farmers' Wives and Phones

The saying "that the hand that rocks the cradle, rules the world," is no better exemplified than in the general use the telephone is receiving by farmers' wives all over the country.

The farmer himself uses a telephone for business purposes almost entirely, but his industrious spouse combines both business and pleasure. A telephone brings the city or town to her very door, yet she can enjoy all the comforts of farm life.

Besides ordering her groceries—telling the meat man to stop—keeping posted on the latest market price of eggs and butter—she makes friends and neighbors with farmers' wives miles away. The telephone keeps her from getting lonely when the family are away—acts as a companion and an ever ready help in case of need. The practical ways in which the farmers' wives use a telephone are numberless.

In speaking of the telephones in the rural districts, an agent for a "Farmers' Telephone" company said: "It's the farmer's wife every time who decided whether an instrument shall go in or not and I have to make my arguments accordingly. If she says no, that settles it. The farmer will have nothing more to do with me unless she changes her mind, which she generally does when her neighbor, Mrs. Smith, a mile or so down the road, tells her what 'solid comfort' a telephone is.

"The uses to which a woman can put a telephone are simply surprising. One woman went so far as to hold the regular business meeting of a sewing society over the 'phone. Another had a friend give directions over the 'phone about a crochet pattern for a tidy. She had her son hold the receiver to her ear while she crocheted according to directions. Of course, some of the other subscribers got rather hot about it until the operator at the switchboard had to 'butt in' and call off the tidy lesson."

"But one case where the farmer put in a 'phone in spite of his wife, was as follows: He argued and argued, but she was obdurate. Finally he said: 'He'll just have to put it in the hen house, for when we married we agreed that he was to have charge of everything outdoors and I of everything indoors. I ain't going to have a telephone always ringing in my house. Henry says the telephone will help him in his business and if that is so he can have it in the hen house and attend to it himself. So the bell jangled merrily amid the crows of the roosters and he cackle of the hens for a month, when it was moved into the barn. From there it soon made a jump to the kitchen, where it was almost at the good wife's elbow. She said pologetically that its ring was 'so ort o' cheerful that she hated to have it wasted on the cows and horses in the barn."

A grass widow shouldn't wear mourning,
Her husband's forgotten, not gone,
The appropriate thing for grass widows this spring,
Is a cute little frock of green lawn.—Ex.

PRODIGALITY.

Aubrey—"Look here, old chap, let me give you a piece of my mind."
Percival—"Won't it be robbing you, deah boy?"—Sketch.

Coulson's No. 3

Condition Powder For POULTRY

If you are not already using COULSON'S NO. 3 CONDITION POWDER, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season. If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

WE CLAIM COULSON'S No. 3 Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in. We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are beginning to molt heavily, their combs are as bright and red as at the beginning of the season. You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably. Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want. Where the local dealer does not keep it, we will make you a SPECIAL OFFER to deliver it freight prepaid to any Railroad Station in California, at the following prices:

10-lb Package, \$1.50; 25-lb Package \$3.25;
50-lb Package, \$6; 100-lb Package, \$11.

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

GET SOME NOW AND INSURE YOURSELF
LOTS OF EGGS WHEN PRICES ARE HIGH.

Office 830-832 S. Main St., Los Angeles.

The opening of the Yakima Indian
reservation at North Yakima, Wash-
ington, which many have expected to
be accomplished soon is now claimed
to be some distance in the future.
These lands are said to be extremely
valuable for farming purposes.

Hop growers near Eugene, Oregon,
maintain that hop dealers' statistics
are inaccurate and given out for the
purpose of bearing the market.

The highest priced car of pears ever
sold in New York was from Medford,
Oregon, which grossed \$4,622.80.

Garfield county, Washington, farm-
ers are sowing fall wheat.

Some Texas mohair-producers sold
their fall clip at 35 cents per pound.

CONGO THE NEVER-LEAK ROOFING

STOP THAT LEAK

THE rain will damage
the contents of the
building and ruin the build-
ing itself.

A leak in the roof, no
matter how small, is a leak
in your purse.

The best way to make
repairs is to cover the old
roof with a new roof of
Congo.

Congo is easily laid over
shingles, or tin, or other
ready roofings.

Figure up the cost and you will be aston-
ished how cheaply and easily you can get a
tight, durable, weatherproof Congo roof.
Nails and cement furnished free.

was my intellectual inferior?"

Dolly—"More than foolish—impos-
sible."—Cleveland Leader.

The Largest and Finest Stock of Furniture
in the West

Satisfaction

Is a Very Essential Feature
When You Are Buying Furniture

Do not buy furniture because it is offered
on special sale at apparent great savings.
If the reductions are genuine the quality is
usually inferior and seldom gives satisfac-
tion. Consider carefully the quality, style
and making. It is the long use that tells
the story. Furniture is not bought for one
or two days' use. It is to be associated with
your home for years and if it is not well
made, good substantial furniture it will
never give satisfaction.

Prompt delivery in perfect condition.

Seed Beds.

Will you please inform me in your
paper when and how to plant peach,
apricot and cherry pits, also eucalyp-
tus and grapefruit seeds?

I hope you will pardon me for giv-
ing you so much trouble, but that is
the penalty you have to pay for giv-
ing so much valuable information in
your paper.—A. M. S., Exeter.

The Cultivator expects just that
kind of "trouble" and is glad to
lend a hand.

About the first of December put
your peach pits down on a burlap,
making a layer of pits about three
deep. Over this place another piece
of burlap and cover this with about
four inches of sand which must be
kept wet. The bed should be in a
well drained place and the first or
lower burlap should have a layer of
sand under it. This will prevent
the seed from getting water-soaked,
which would rot them. As the
seeds crack open, pick them out and
plant them in the nursery rows.

Treat apricot and cherry pits the
same, only do not put them down to
sprout till about the last of March
or the middle of April. They will
crack open sooner on account of hav-
ing a thinner shell.

Plant eucalyptus seed in boxes of
rich garden loam. Press it down in
the boxes and settle with water.
When dry enough, even it on top,
sprinkle the seeds on this, press the
seed into the soil with a flat board
and cover with a quarter of an inch
of clean river sand. Sprinkle every
day when it does not rain, till the
seeds are up when withhold the
water; only keep the soil moist
enough to keep the young plants
thrifty. This means a moderately
moist soil. Too much moisture will
cause many of them to rot. When
the young plants get to be three
inches high, transplant into flats.

In planting pomelo seed, select
soil that has no gravel or hard
lumps; make a trench 18 inches
deep, fill up the bottom foot with
earth and well rotted stable manure
well mixed and fill the top six inches
with rich, sandy loam. Plant the
seeds in this in rows about three
inches apart, placing the seeds in the
rows as close as possible and cover
with an inch of clear sand. Keep
moist, but do not wash the sand off
in patches. It is best to make
grooves in the soil to receive the
seeds and thus bring them even with
the surface of the ground. The bed
should be settled with water and
evened with a straight edge before
planting the seeds. This prevents
puddles when irrigating. The seed
bed should be shaded so as to keep
about half of the sunlight out. This
is done by placing a lath cover above
the bed on the sunny sides, making
the cracks as wide as the lath.—J.
W. M.

Cornichon Grapes.

What is the relative value of the
Black Cornichon grape to other ship-
ping table grapes where they do
well? Why are not more planted?
What is the objection, if any? Do
you recommend them? What kind
of soil do they do best on; are they
liked in Eastern markets?—E. J.
Thompson, Fresno.

Purple Cornichon is one of the b
shipping grapes, and sells well in
Eastern markets. It is one of
best carrying grapes known.
relative value with other grapes
depends on how the others arrive
the markets. Cornichon always
arrive in good shape when well pack
and handled properly.

Cornichon likes a heavy sub
hence does best on slightly
soils. It should pay the best in
late district as it is one of the late
grapes and does not crack wh
rained on.—J. W. M.

Grafting Old Vines.

Will some one please state in t
Cultivator how and when is the be
time to graft Muscats on to the
grape vines? I have a few
vines among my Muscats, to
which I wish to graft the Musc
A Subscriber, Parlier.

Graft your old vines about t
middle of March. Cut the stock
with a saw about an inch below t
surface of the ground. Split t
crown and insert two scions, one
each side of the stump. Give ea
scion two buds, leaving the low
one about opposite the top of t
stump. Cover the entire stump ar
scions with soil by making a moun
over the stump. Do not cut t
stump lower than indicated as
lower cut will bring the suckers th
are sure to come, so far below t
surface that it will be a difficult
to keep them out.

If the soil shows that the vines
bleed much, break the dry crus
with a rake in case of absence o
rains about the time the vines star
to grow. This prevents a crooked
and undesirable growth.—J. W. M.

SIDE HILL PLOWS.

The Knapp side-hill plow is one
of the old reliable California-made
plows. The factory was started in
Half-Moon Bay some thirty years
ago by H. G. Knapp, and the stan-
dard high standard has been kept up
the manufacturing of it during these
many years. They have just move
to San Jose. They have enlarged
their plant and are prepared to
handle the growing demands much
better than ever before. Their dis-
play at the State Fair at Sacramento
attracted much attention and car-
ried off the medals.

They also manufacture large
grading plows.

It would be well to have their
catalogue and price list. A post-
card will secure it if you mention
the Cultivator.

THE PALMA TROPHY WINNERS.

The greatest Rifle Match held since
1903 was shot at Ottawa, Canada, on
September 7th. The American Team
consisting of eight shooters, won the
Palma International Trophy Match,
which was open to the military teams
of the world, and was contested by the
best military shots from England,
Canada, Australia and the United
States. The winning score of the
American team was 1712. The other
teams ranked as follows: Canada,
1671; Australia, 1663; Great Britain,
1580.

The Union Metallic Cartridge Com-
pany by furnishing superior U. M. C.
cartridges gave to the finest team
which ever represented America, a de-
cided and winning advantage as was
admitted by the press of the United
States and Canada.

General Agriculture

USE OF THE DIVINING ROD.

NUMEROUS devices are used throughout this country for detecting the presence of underground water—devices ranging in complexity from the forked branch of witchhazel, peach, or other wood, to more or less elaborate mechanical or electrical contrivances. Many of the operators of these devices, especially those that use the home-cut forked branch, are perfectly honest in the belief that the working of the rod is influenced by agencies—usually regarded as electric currents following underground streams of water—that are entirely independent of their own ideas, and many uneducated people have implicit faith in their ability to locate underground water in this way. In experiments with a rod of this type, one of the geologists of the United States Geological Survey found that at points it turned downward independently of his will, but more complete tests showed that the downward turning resulted from slight changes in the inclination of his body, the effects of which were communicated through the arms and wrists to the rod. No movement of the rod from causes outside the body could be detected, and it soon became obvious that the view held by other men of science is correct—that the operation of the “divining rod” is generally due to unconscious movements of the body of the muscles of the hand. The experiments made show that these movements happen most frequently in places where the operator's experience has led him to believe that water may be found. The uselessness of the divining rod is indicated by the facts that the rod may be worked at will by the operator, that he fails to detect long currents of water running in tunnels and other channels that afford no surface indications of water, and that his locations in limestone regions where water flows in well-defined channels are rarely more successful than those dependent on mere guesses. In fact its operators are successful

only in regions in which ground water occurs in a definite sheet in porous material or in more or less clayey deposits, such as the pebbly clay or till in which, although a few failures occur, wells would get water anywhere.

Ground water occurs under certain definite conditions, and as in humid regions a stream may be predicted wherever a valley is known, so one familiar with rocks and ground water conditions may predict places where ground water can be found. No appliance, either electrical or mechanical, has yet been successfully used for detecting water in places where plain common sense or mere guessing would not have shown its presence just as well. The only advantage of employing a “water-witch” as the operator of the divining rod is sometimes called, is that skilled services are obtained, most men so employed being keener and better observers of the occurrence and movements of ground water than the average person.

FARMERS AND HIGH PRICES.

There is a wonderful deal in being ready for a good thing when it comes. Sometimes a farmer misses the high price of the season because his cattle, sheep or hogs were not in market trim at the right moment.

This might have been a fault in the stock, but more likely it was a fault in the farmer, because there are well-established ideas and principles at the bottom of the feeding business which point a sure way to hasten and perfect all animal growth and development.

Ask a successful breeder of cattle of a man who turns off his fat droves once or twice a year, and he will tell you, “my dear sir, it's all in the tonic—you can't fatten steers, hogs, sheep, or fit a horse for the show ring or for sale without using every day the proper food tonic,” and this man's testimony would be just what thousands upon thousands of others would say if it were possible to ask them the same question.

It is a well-known fact by every man who owns a domestic animal, that heavy feeding is likely to upset the di-

gestion and make the animal “go back.” Why this is so is also well-known—no animal stomach is sufficiently strong to stand the continual stuffing that is necessary to make a desired weight in a certain time. Hence, the feeder is constantly facing a possibility of loss even before he is ready to reap his gain.

Just here a knowledge of the “tonic idea” comes to help the feeder out. It tells him that a “food tonic” given regularly (at small cost) to the steer, cow, horse, hog or sheep which is being fitted for market, will remove the possibility of digestive disorder and by increasing assimilation actually shorten the time necessary to fatten the animal. Every day gained in this way is, of course, so much on the profit side of the account and well worth considering when the final balance is struck.

These things being so, it is evidently sound business to use the “food tonic.” Thousands are doing it, as the increased demand for it proves.

There is abundant evidence of the value of this “food tonic” idea in the actual practice of interested parties, but an added force is given by the unqualified indorsement of such men as Professors Winslow, Quitman and Finley Dun—men known everywhere as authorities on such subjects. They tell us that bitter tonics are necessary to strengthen digestion, that iron is the best known blood builder, that ni-

trates cleanse the system of poisonous matter, and these are the ingredients which enter into the proper “food tonic.”

Using a “food tonic,” then, becomes a practical farm economy—one of the steps which lead to satisfactory profit.

That it gives great returns is proved by well-attested experiments—in one case the outlay for the “food tonic” being returned with a profit of 235 per cent. In view of this fact we are led to this conclusion—no man owning live stock, farmer, feeder or breeder, is rich enough to leave the “food tonic” idea out of his calculation when business possibilities are considered.

ENJOYS IT VERY MUCH.

I enjoy reading the Cultivator very much and get a great amount of information from it.—R. L. Price., Sanger.

Public Sale of Shorthorn Cattle

Thursday, Nov. 14, 1907.

Sale Begins Promptly at 12:30 P. M.

T. B. Gibson and H. P. Eakle, Jr., will sell at public auction 76 head of Short-Horns on the farm of Mrs. W. B. Gibson, one mile from depot. This offering consists of 39 bulls, including the pure “Scotch” bull Saturn, 37 cows and heifers. In this offering is the get of Noble Knight, Saturn, Brampton Hero, Senator Lad and King Spicy. Everything will be offered in good breeding condition, and will prove useful to the buyer. Remember the date and come to the sale. Write for catalogue, mentioning this paper.

H. P. Eakle, Jr., T. B. Gibson, Woodland, Cal.
Col. Geo. P. Bellows of Maryville, Mo., Auctioneer.

A Life Income from Land Investment

7 per cent. guaranteed, payable semi-annually. No risks. Sugar plantations pay 33 1-3 and more when in full cultivation. One planting good for dozen years.

We own 9489 acres of richest land in State of Vera Cruz, Mexico, near Tampico. Sell you one to a hundred acres and contract to cultivate for fifty years and pay you the profit.

Best Crop Profit in the World

No other crop in the world as rich or as certain. Our plan is simple and safe. Your money does the work for you.

We Do All the Work—You Stay at Home and Enjoy the Profit

It will pay you to know more of our sugar plantation profit-sharing plan. George Gould, speaking of this section, says: “The great Southwest will surprise the world in the next ten years with its development.” Let us tell you more.

All Hallows Eve

HALLOWEEN.

The breezes are rippling the river,
An moonbeams are ghostly and white;
How strangely the maple boughs quiver,
How eerie the sounds of the night!
I wonder what mystery thickens,
What terror environs the scene;
Or is it but fancy that quickens,
Since this is the weird Hallowe'en.

A farmhouse I see in the distance,
Gray-gabled, half lost in the shade.
I watch with no thought of resistance,
For from it there hastens a maid;
'Twas Cupid who guided, I'm certain,
My lassie and I, and between
Us lifted the future's dark curtain
So kindly this weird Hallowe'en.
—M.

THE evening preceeding All Hallows or All Saints' Day, which is November 1, is called All Hallows eve, or more commonly Halloween; also sometimes "nut crack night," "ghosts' night," etc. This year it, Halloween, occurs next Thursday eve, and that fun will be doing amongst young people goes without saying. That patience will be required of older folks also, goes without saying.

To the older folks we say be patient.

To the youngsters we say be considerate.

By the way, if there are any "old folks" around on Halloween, let them get busy and be young again. Old folks who are sedate need a shaking up about once a year, and Halloween is a good time to renew youth. Get out and frolic with witches, habgoblins and fairies.

Turn in and have fun. Genuine, hearty, wholesome fun. But don't destroy and don't do any thing that will give the slightest unhappiness, for the fun you might get. For the unhappiness you bring others is sure to react on you.

There are thousands of jolly ways of having fun without annoying others. Study them out for this year's celebration of Halloween.

Instead of the wild lark up and down the streets, gather in the home and on the lawn and have the time of your life.

Here are some suggestions:

Among the quaint customs and superstitions handed down to us is the belief that spirits and witches are abroad on Halloween, representing both the powers of good and evil. The spirits are invoked in the reading of future destinies and maidens seek to find out the appearance and character of the men they are going to marry, by various tests. One is to arrange three bowls in a row; in one place clear water, in another coffee, and in the third tea; dip into them blindfolded; the clear water indicates a young husband or wife; the coffee a widower or widow, and the tea a bachelor or spinster.

Another way to determine the important question is to pare an apple, turn around three times, repeating this doggerel:

St. Simon and St. Jude, on you I must intrude,
For by this paring I discover the first letter of my lover.

The paring is then tossed over the

left shoulder, forming some sort of letter which is interpreted accordingly.

Or here is another verse some prefer:

Apple, I pare and swing to know
Who I soon will marry;
From my hand I now thee throw,
Mystic letter carry.

Fill a hulled out half pumpkin with nuts, having dyed or painted one of them red and concealed it among them, serve, requesting each guest to take a handful; when all have been removed see who has gotten the red one, which signifies:

Such good luck will follow you all the year,
You'll be so happy you'll never shed a tear.

Take two brown apple seeds, name them and stick one on each cheek, repeat:

Pippin, pippin, I stick thee there,
That what is true thou may'st declare.

the one that falls off will prove unfaithful.

Enter the garden unperceived, move around in a circle three times, scattering hemp seed with one hand and dragging a hoe with the other, repeating, "Hemp seed I sow, Hemp seed I hoe, and he that is my true love come after me and mow." Glance over the left shoulder shows the future husband.

From Scotland comes the test known as the three luggies. Three dishes or luggies are placed in a row. One contains clear water, another dirty water and one is empty. Each player is blindfolded and in turn dips into one of the luggies, the position of which is shifted before each trial. The clear water means a happy marriage; the foul, an unhappy one, while the empty dish signifies that the player will remain single. Burns thus sings of this custom:

In order on the clean hearthstone
The luggies three are ranged,
And every time great care is ta'n
To see them duly changed;
Auld Uncle John, wha wedlock's joys
Sin Mar's year did desire,
Because he gat the toom dish thrice,
He heaved them on fire
In wrath that night.

Another custom of his country to which Burns refers consists in wetting a shirt sleeve on Halloween, then hanging it before the fire and lying in bed, watching it till midnight, when the maiden who is brave enough to test the charm is assured that the apparition of her husband to be will come in and turn the sleeve.

The last Hallowe'en I was waukin'
My droukit sark-sleeve, as ye ken;
His likeness came up the house staukin',
And the very gray breeks o' Jam Glen!

Suspend in a doorway an orange, an apple and a doughnut and a ball of cotton. Blindfold the contestants and let them try to fasten their teeth in one of the objects. The one biting the orange will be rich, the apple, happy; the doughnut, work hard, and the ball of cotton be condemned to a life of single blessedness.

Fortune telling is in order. Let the Gypsy hang up a sign like this:

"To beau and belle I fortunes tell,
Come round the gypsy—she'll use you well;
Come maidens dear, and never fear
A little who'some truth to hear."

The telling of fortunes from the grounds and leaves left in the bot-

Dr. A. Polasky

Oculist and Optician

Formerly of Des Moines, Iowa, and known to hundreds of clients throughout the Middle West, is now located in Los Angeles with offices at 317 West Third Street. Practice limited to the correction of the most difficult cases of defective eyesight. Forty years of continual practice. Examination free.

The Personal Neatness Club

WELL, our club seems to have been crowded out for the past few weeks, but here comes a number of inquiries and friends with hints so that some of the hints must be laid over till next or some later issue. We hope interest will increase that space will be demanded each week, a little later.

Neat Room.

The first comer has an inquiry on the most pertinent subject. It is one which I hope a missionary spirit will prompt some one to send in suggestions.

"Won't some helpful mother who has succeeded in encouraging habits of neatness in her daughter, tell me how to get my daughter to keep a tidier and more attractive room?"—Perplexed Mother.

I hope some one will send in some hints along this line. But as the first hint for a starter. May I ask: Has the girl been given encouragement to start with. That is, is she given anything for a foundation, such as closet hooks, bureau or other drawers for neatly storing her things? Has she set a good example in other parts of the house? Is she scolded because of her laxness, or is she encouraged with "let's see if we can't make some changes for the better in your room and then try and keep it tidier?"

These questions are not meant as an arraignment of Perplexed Mother, for that probably would not be deserved. But some mothers are not tactful in encouraging. They too often nag. That accomplishes little; sometimes worse than nothing.

But if father or brother will make a shirtwaist box with tray, which may be a lounge or window seat when the lid is down, for storing some of the waists and skirts, then the room neatly arranged once, the attractive appearance may appeal to the awakened appreciation of order and a little expression of admiration for the new condition fix a habit for the better.

Meantime, won't some mother who has tried, send us more hints?

School Dresses.

Along somewhat the same line, M. A. Y. sends in hints regarding dresses of the school girl. I agree with her. In general, we may say that school girls are given altogether too expensive and showy clothing. The tendency is toward too much display. Some of the poorer girls are driven from school by the fact that they are unable to appear as they would like. This is unfortunate. It is serious in some sections.

Let the suggestions of M. A. Y. are regarded, for we must keep our own children where they need not be ashamed of their appearance. Keep in mind the distinction which the water makes between "showiness" and "neatly and becomingly."

Dressing the School Girl.

The desire to be neatly and becomingly dressed is praiseworthy, rather than to be condemned, and it respects the girl's self respect to know they are as well dressed as their companions, and they cannot keep feeling humiliated if their dresses are faded, shabby or outgrown. Everything like showiness should be avoided in their school dresses, but they should be of a becoming color and made of stylishly and of materials that will

stand usage. Such material that can be cleaned or washed when soiled, are the most appropriate for school wear.

The majority of women wish to use everything to the best advantage and by examining the contents of the closets and wardrobe, you may find partly worn dress skirts or other articles of wearing apparel that can be made into serviceable school dresses, and children seldom object to wearing made-over clothes if they are made up pretty and stylish.

One pretty little dress was made from an old white wollen serge suit, but the pieces were first washed clean and then colored a rich, dark green with diamond dye for wool. Some faded pink challie was colored a dark shade of red and fashioned into another pretty dress.

These dresses were made to be worn with a guimpe, which is the best way to make school dresses, as the sleeves soon become soiled, and the separate waists can easily be laundered, and several different kinds can be worn with the same dress.

Do not be careless about the fit of children's dresses. A dress of handsome material may be ruined if the waist is too long or the skirt too short, while an old one made over may be quite stylish, because the mother has taken pains with her work. Give the children pretty clothes to wear, because many a child suffers from the jeers of play fellows when they must wear outgrown and faded garments to school, and a plain garment can be made a joy to their eyes with a little bright trimming and braid, velvet and ribbon can all be freshened by cleaning and often a dainty little garment can be made without any present outlay of money.—M. A. Y.

The next two hints are not exactly of a personal nature, save as the home is an expression of our personality, but they are too good to lose or to miss having in this department. I've most a notion to tell you who sent them in. Pretty nearly every one in California knows her. She has written for the Cultivator a long time, and most interestingly, too. By the way, she knows pretty nearly everything, so if any questions come which none of the rest can answer, we will refer them to her. She will have something for the next Club department.

The M. E. S. stands for Minna Eshelman Sherman and she lives on Minnewawa ranch at Fresno. May she come often.

Ink on Carpet.

If the ink bottle is overturned on the carpet, pour cold water on it and then bring down a large pitcher of water and old cloths and a bucket to wring them out into. Pour on the water, sop it up, and repeat this until all the ink has disappeared. The secret of getting ink stains out is never to let it dry.

Blackening a Stove.

Linseed oil is a good agent in the house, mixed with vinegar half and half and applied with a cloth, it blackens stoves. The ordinary stove polish is apt to make black spots on the aprons and sleeves when water splashes it on to the clothes. This is troublesome as it requires to be removed before sending to the ordinary laundry. The black can be removed by using lard and washing it out before the laundryman gets the clothes.

Furniture Polishes.

Spirits of turpentine added to linseed oil, five parts of turpentine to one of oil, cleans the carved work of furniture nicely.

Using linseed oil and then spirits of ammonia will take out the marks left on the table by hot dishes. Use them alternately, rubbing until the marks disappear.—M. E. S.

For Butchering Time and All the Time

Besides being a necessity at butchering time, the Enterprise Sausage Stuffer and Lard Press is equally useful as a Fruit Press when making wine, jelly, etc. The

ENTERPRISE Sausage Stuffer AND LARD PRESS

saves much of the hardest work of butchering. It is well made and does its work without a hitch. The cylinder is bored true. Meat cannot rise above the plate. Corrugated spout prevents air entering casing, and assures perfect filling and preservation of sausage.

The Enterprise Meat Chopper cuts sausage meat without grinding or crushing, and is useful in preparing other foods. Ask your dealer for these machines. Look for the name "Enterprise" on the machine you buy. Write for the "Enterprising Housekeeper," a book of 200 choice recipes and kitchen helps. Sent free.

LOS ANGELES, CALIFORNIA

WITH A SEIVERT OIL BURNER

You can burn 100,000 feet of air with every 130 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 130 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel. The only safe and reliable burner on the market. Send for full particulars.

SIEVERT OIL BURNER CO. 1001 No. Alameda St., Cor. Main and Ord Sts., Los Angeles, Cal.

LINERS

BERRY PLANTS.

WANTED—ONE-YEAR OLD LOGANBERRY plants. Address, P. O. BOX 2697, Fresno, California.

Potatoes.

At present the potato market is slightly stronger. An observer of the market says:

There are some who are predicting a strengthening in potatoes next week as a result of today's rain as it is figured it will temporarily restrain growers from digging, but even though this be a fact, the amount of potatoes on track at the present time is sufficient to supply all demands for a week or more even though another sack of potatoes does not arrive within that time. The final outcome will be that when growers do begin shipping again the shipments will be bunched together so there will be a more congested condition than had the steady inflow been uninterrupted.

Citrus Market

LOS ANGELES, Oct. 23rd, 1907.

The citrus market seems to be out of sight, both as to prices and as to what to forward. The one lone car reported from the auctions this week was in New York and it commanded an average of \$6.00 per box.

Northern new oranges are now being picked, but no report is in hand as to how they will be received.

Shipments to date this year are, 27,000 cars, of which 3440 are lemons. To the date last year, 25,871, of which 17,000 were lemons.

Oranges are commanding prices up to the fabulous. Regarding the prices, a N. Y. dispatch in a Chicago paper says:

If the shippers of California Valencia oranges are wearing anything like the same kind of a smile as their representatives in the East are, it certainly would be a great pleasure to look upon them. The sales of California oranges this week have been unusually satisfactory. There have been no extreme prices, although some very heavy fruit has gone as high as \$8. Offerings have been sufficiently large to hold the market steady with a gradual advance at each sale.

Advices from Florida show that a large quantity of oranges have been shipped, but no amount. Today the E. R. Brackett Co. received the first car to reach the market. The car was loaded at Alligator Creek, a little station near Fort Meyers, and left last Saturday. On examination the fruit was found to be very good, reasonably well colored and when the oranges were cut they tasted sweet. The car did not arrive in time to offer this morning, but Mr. Brackett thought the prices would range \$2.75@3.50. It is not expected that any real good Florida oranges will be in the market for a month. Some immature fruit will probably be here next week.

There are a few Porto Rican oranges here, only a few hundred boxes being sold this week. For this early in the season the fruit is nice and is bringing excellent prices.

Notwithstanding the fact that there is a large quantity of grapefruit on the market now from Florida, Porto Rico and Jamaica, all of good quality for so early in the season, the California product is selling to excellent advantage. Prices are somewhat lower than last week, but at Thursday's sale as high as \$2.85 was realized for half boxes. This is practically the windup of the California grapefruit season, and although there may be a little here next week, it will, no doubt, be about the last. Receipts of Florida grapefruit here have not

been very heavy this week, but have been about as large as were wanted." Lemons are not commanding the fancy price which oranges are, but the market has a healthy tone.

FINE POTATOES.

A. J. Young, seed potato grower and propagator, of Santa Ana, supplies us with the illustration of a new potato "Harvest King," which he has propagated and grown successfully at his ranch west of Santa Ana, for some time. It is of exceptional quality and of most desirable size and shape.

Of this and other varieties, Mr Young will plant over 50 acres this year.

ALL HALLOWS EVE.

Continued from Page 404

tom of a teacup is of so ancient an origin that its beginning seems lost in obscurity. The gypsies have made use of this medium from earliest times, and one has only to look through an old book upon the subject to discover how many have been the people who have believed in this sort of future telling.

Read the future with kindness. In making up the story consider the one whose fortune is being told. Some sensitive people take as real many things said in merest jest. If you have to deal with one of these supersensitive ones predict some good with the jokes to be given.

A Halloween apple test that causes much merriment is as follows: A pole is suspended horizontally from the ceiling by means of a rope. On one end of the pole is an apple, on the other end a lighted candle. The pole is started to twirling, and the lad or lass whose fortune is being tested must catch the apple, which, of course, represents his or her sweetheart, with his teeth.

Ducking for apples is one of the most ancient and most popular of Halloween games. A tub of water is placed in a convenient place. Then initials are scratched on apples and they are set floating on the water. Each player in turn "ducks" for an apple, which must be picked up with the teeth. The initial indicates the initial letter of the future husband or wife, and the number of times one ducks before securing an apple tells the number of years until the wedding.

If you want to know the number of years which must elapse before you marry, hold a silk handkerchief in front of your eyes and look at the moon through it. To get the charm just right the handkerchief must be one which has never been washed; when as many years will elapse before marriage takes place as there are moons seen through the intricacies of the silk.

DECORATIONS.

For Halloween decorations use ripe grain, corn stalks, pumpkins, autumn leaves, if you can get them. If they can be had in abundance, strew over carpet and surround room with the stalks and boughs of trees to give as weird a look as possible. If any draping or paper decoration is used, let the color be red, black, yellow or white. Paper mache snakes and masks and skulls may be made use of, but use the snakes sparingly. Use Jack o'lanterns everywhere.

Little lanterns, paper mache pumpkins, may be placed at plates as favors.

Vegetables make nice decorations. A big cabbage with coarser leaves, removed and inside scooped out makes a fine vase for a bouquet of carrots, beets, ears of corn, onions or parsley. Make candlesticks of potatoes, etc.

A center decoration of table, may be a witches' caldron on tripod. Around the caldron and at a little distance from it arrange a circle of candy witches and attach to the waist of each a narrow, black ribbon that leads to the plate line, where it terminates in a small envelope ornamented with the figure of a witch cut from black paper. This envelope should contain a prophetic sentiment or verse relating to love and matrimony. To avoid anything like a personal allusion in these prophecies, and to heighten the fun, the guests should be allowed to select their own seats. Use wooden picnic plates decorated with pictures of witches.

TALLERDAY SURFACE IRRIGATION PIPE

SAVES WATER, GRADING AND TIME

The only way to Irrigate Alfalfa. Cheaper than Flumes. This is only one of our specialties. We make Riveted Water Pipe in lengths of ten feet from single sheets. Let us prove to you that we make Pipe and Tanks right. WRITE FOR CATALOGUE.

TALLERDAY MANUFACTURING CO.
636-7 Pacific Electric Building Los Angeles, Cal.

Does this stream of water look good to you?
It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs. It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago.
How many pump users can say this?
It shows conclusively that it pays to install good machinery. We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

Natural Forest in San Bernardino Reserve

STREAM flow consists of both surface run-off and seepage run-off. Although these two cannot be separately determined, total run-off admits of accurate measurement. Surface run-off may be considered as flood water, while seepage run-off is that portion of the drainage which gives the streams a sustained flow. It is evident that any factor which decreases the surface or superficial run-off and increases the seepage run-off is of the most importance in regulating the flow of streams.

The proportion of flood water to seepage is influenced by the rapidity of the rainfall. It is well known from direct observation that a slowly falling, prolonged rain, even on the naked soil of steep slopes, is all taken up by the soil. On the other hand, a heavy shower of short duration, falling on the same slope, may largely escape as run-off. In the first instance each drop has time to be absorbed by the soil, while in the latter the accumulation of drops is more rapid than the absorption, and the excess moves over the surface to the lower elevations. The forest canopy very perceptibly extends the period of time during which the rain reaches the soil, and in this way lessens the surface run-off.

Again, forests, by checking the velocity of the wind and covering the mineral soil with a thick layer of dead leaves and other forest litter, effectively prevent soil transportation by both wind and water. On high elevations, where streams generally have their birth, the influence of the forests in this respect is of the utmost importance. So great is this influence that it exerts a marked effect on topography. In mountain regions particularly, the repeated destruction of forests permits the soil formed by the decomposition of the rocks at the sources of the streams to be transplanted to lower elevations, with a constant slow change in the details of the landscape. Such regions, if unforested, are apt to have precipitous slopes and scanty soil on the higher elevations. In that case there is no adequate medium to absorb the rain, and it flows over the surface. On the other hand, if such regions are well wooded, the slopes are less precipitous, and a considerable depth of soil usually covers the broad summits. As a result, the rain water is absorbed and the surface flow is reduced to a minimum.—From an article prepared by Jas. W. Toumey, Colaborator Bureau of Forestry, and used in Pamphlet of Tri-Counties Reforestation Committee.

The One-Man Road Machine

Easy to guide; strong, compact and easy adaptable to every condition demanded. It needs but one man and two horses to operate it. Notice the "no skid" rudders on the wheels. They are raised in the picture; when lowered they guide the machine straight ahead. The moldboard is 6 feet long. Has adjustable shoes shown at ends of moldboard to gauge depth to which moldboard should cut. It's a very desirable machine for road-building in city or village. It makes good roads and keeps them so. Although made of steel and malleable iron, still it weighs only 600 pounds. The

20th Century Grader

saves time of three men and two extra horses. It is easy on the horses. Has blade in front of wheels. Moldboard reversible. Machine turns in 6 ft. circle. Built for road-grading, Ditching, Land Leveling, Foundation-digging.

For Irrigation, Canal Building Etc.

The price is lower than on such machines. We send on free trial. Write us for our handsome booklet, "Delightful Roads." It's free and tells you all about the 20th Century

The Greatest Need of Arid America

Prof. Samuel Fortier in His Talk Before the National Irrigation Congress Says Our Greatest Need is Industrious Settlers

OPINIONS will differ as to what constitutes the greatest need of arid America at the present time. The numerous wants of the new, sparsely settled region are not readily applied. When the region embraces two-fifths of the area of the United States and holds within its confines the destiny of fourteen young commonwealths its needs are multiplied many times. The remedies proposed are as varied as the conditions and obstacles. Better and cheaper transportation is one man's remedy, more capital to develop our resources is another's, while a third is in favor of establishing manufacturing plants. Many favor the further construction of irrigation canals and storage reservoirs and the preservation of the forests as the best means of benefiting the West.

While these and others that might be named are destined to play an important part during the next few years, none is deserving of a first place. In my humble opinion none of these are so important as the establishment of prosperous rural homes in the sparsely settled irrigation districts of this country. When one reviews the conditions which exist in the West today he is forced to the conclusion that our greatest need is to obtain a sufficient number of desirable white settlers and to assist them to such an extent that they will be able to overcome the difficulties peculiar to a new farm and to establish happy and prosperous homes.

In the brief time at my disposal I shall try to convince you that the West has reached that stage in its irrigation development when a large number of industrious settlers are an absolute necessity if success is to be attained. I shall endeavor to convince you that the rapid construction of irrigation works during the past few years is likely to progress far in advance of the actual settlement of the lands reclaimed and that unless settlement follows closely after construction much money will be lost in the maintenance of these works. Since, also, the main object of all irrigation works is to render the soil productive and since the presence and labor of farmers are necessary to accomplish this end, it will be my endeavor to point out ways and means of assisting the farmer in this most important task.

Lands Open for Settlement.

It is sixty years since Americans first began the practice of irrigation. Their efforts in that line have resulted in the settlement and cultivation under irrigation of something like eleven million acres. Of this total about ten million acres are to be found in the arid States and Territories. The conversion of so large an area of barren sands into productive farms and orchards and the establishment of the many industries which these fields and orchards foster and maintain has not proceeded with any great degree of regularity. There have been decades when little progress was made and these have been followed by periods of the wildest expansion. In no period of the past has such progress been made in the construction of irrigation works as has followed the passage of the Reclamation Act of 1902. At no other like period in the history of the West has so large an area been thrown open for settlement. This is shown by the following figures.

Two or three weeks ago I sent requests to a large number of State engineers, canal superintendents, land commissioners and others for the

purpose of ascertaining with some degree of accuracy the extent of unimproved lands provided with water rights which would be open for settlement in 1908. The most conservative of the estimates received from nine Western States and Territories are as follows:

Reclamation projects..	1,100,000 acres
Carey Act projects.....	975,000 acres
District organizations ..	400,000 acres
Private enterprises.....	1,300,000 acres

Colorado, Montana, Kansas, Nebraska, Oklahoma and Texas are not included in the above estimates. It is, therefore, no exaggeration to state that there will be five million acres ready for the plows of the new settlers before this Congress meets again. This means 100,000 families, number half a million people, and half a million more will be needed to occupy the towns and villages that will be created and to carry on the many industries which five million acres of intensively cultivated land is certain to develop and to foster.

No Shiftless Trash.

It would not be so difficult to secure a million people if all were permitted to come without reference to means, credentials or color. The indolent and shiftless beings who crowd the unhealthy tenements of Eastern cities might be induced to migrate, but only a small percentage of these have strength of either mind or body to become successful farmers. The large majority of this class would retard rather than advance the interests of Western communities.

Again, if we were to open our gates to Asia's millions there would be no difficulty in placing a yellow family on every ten-acre tract. But the people of the West, especially those of the Pacific Coast States, believe these productive plains and valleys bordering on the Pacific, barricaded by mountain fortresses and watched over by the silent peaks of a Whitney, and a Shasta, a Ranier and a Hood, were destined by the Almighty for a white man's country.

It is true the West needs settlers, but its needs are not so great that it can afford to adopt every one who crosses either the Pacific or the Missouri. The opportunities which it has to offer in the way of soil, climate, products and social conditions are such as ought to make the best class of citizens eager to come. It is to this class of citizens that the West is extending the warmest of welcomes. It wants the sons and daughters of the pioneers of the Mississippi valley who have grown tired of raising corn to try the more interesting and more profitable irrigated agriculture. It stands ready to hand over its dairies to the Norsemen, its sugar beets to the German and its vineyards to the Italians. With one hand towards New England and the other towards the South, it extends an invitation to the children of both Puritan and Cavalier to settle in the West and blend forever into the highest type of civilization what is best in both races.

Consequences of Failure to Obtain Settlers.

What if the West should fail to obtain a sufficient number of the right kind of settlers? The consequences could not but prove disastrous in direct proportion to the number of farms left tenantless. Were this to happen the States and Territories west of the Missouri river would be in a condition similar to the stockholders of a splendidly built hotel, with costly equipment, who are compelled to run it at a loss, because of the small number of paying guests. Like the

commodious hotel, the large irrigation system cost nearly as much to maintain and operate for a small number of widely scattered farms as for the entire acreage under it.

Those of my hearers who lived in the West during the latter half of the 80's and the beginning of the 90's know something of the large number of irrigation enterprises which were then projected, of the mad rush to acquire rights in streams and of the millions that corporations hoped to make by the sale of water rights and the collection of water rentals. When the crash came in 1892 and 1893 I was in charge of an irrigation system in one of the Rocky Mountain States. This system was begun in 1889, and in three years \$2,100,000 had been expended on its construction. The plan was to irrigate 200,000 acres by selling water rights at \$10 per acre and collecting an annual rental of \$1 to \$2 per acre. The men who put money in this undertaking lost all the interest and the greater part of the principal. The water supply was abundant, the system was substantially built, but failure resulted in not being able to get enough settlers to cultivate the land and use the water. Then, years after beginning construction only 14,000 acres were irrigated and of the total, one-half belonged to the canal company. The maintenance and operation expenses of so large a system could not be reduced beyond a certain limit and this limit was always far in excess of the revenue derived from water rentals.

The record of this enterprise is similar to scores of others that might be given. Probably 95 per cent of the capital invested in canal enterprises from 1885 to 1895 produced no dividends; and much of it was entirely lost. Many cases contributed to this end, but the three which stand out prominently were the heavy annual expenses in maintaining and operating new systems, the long delay in securing settlers and the inability on the part of many of those who did come to expend considerable money and from one to two years of unprofitable labor in putting desert land in a condition fit to cultivate and irrigate.

Must be Overcome.

While I have no desire to dampen the ardor of this large audience, yet it is a fact that the same causes which wrecked so many irrigation enterprises fifteen years ago are operating today, and unless measures be taken to overcome their effects promising enterprises will result in failures.

Western enthusiasts tell us the irrigation problem is solved, and to confirm this view they point with pride to the construction work that has been done during the past five years. We are told that over seventy-five million dollars have been expended in that time under Federal, State, district and private enterprises in providing water supplies. We all rejoice in the accomplishment of so great a task, but a greater task is still to be done. The irrigation problem is only half solved. Statesmen and capitalists alike have failed to realize that no irrigation enterprises can be successful without farmers and that it is the labor of farmers which determines the value of such properties. Corporations and districts may organize for the purpose of utilizing the streams, contractors under the Carey Act may provide for thousands of acres of sage

With the Citrus Growers

CITRUS TREES ON THE DESERT.

THERE seems to be a bright future for lemons and early oranges in the Imperial valley. There are trials being made of late oranges which seem to be out of place. The navel orange is, without doubt, the variety for this section. It is early, and being of a drooping nature, is well adapted to protecting itself from the sun and reflection from the ground. Thomson's Improved is, perhaps, a good strain of the navel as it colors up earlier than the Washington navel.

It is a mistake to try to train orange trees of any kind in this section, so as to force a high growth. We had occasion to examine some Mediterranean sweets that had been planted with high tops. These had become yellow within a foot of the ground and a dense growth of sprouts had started from the base. Every tree in a plantation of a dozen or more, grew in this manner. The finest and thriftiest trees in many plantations observed by us were low-growing trees that shaded the trunks and the ground under the trees. Here is a pointer from nature that will stand many desert growers in hand.

Sunburned Trees.

We have been told with implicit faith by farmers in the Imperial valley that trees of all kinds never sunburn. They have seen their trees sunburn in other parts of the State, but in the Imperial valley the sun refuses to act in that capacity. In one case, a farmer had planted a dozen peach trees, all of which, "from some reason or other," had died to the ground and sprouted from the root. These sprouts had grown vigorously and without sunburn, but they had leaves on the stems from the ground up. The tight, discolored bark on the sunny side is a sure indication of injury by the sun. Any kind of wrapping will make the trees more healthy and longer lived. If old sacks are not to be had, arrow weed so plentiful along the canals, will make a good protection. All kinds of deciduous fruit trees should be pruned as low as six or eight inches when planted. This will provide a natural protection from the sun, and make a much more convenient tree to pick from. This problem was worked out years ago in the Sacramento and San Joaquin valleys.—J. W. Mills.

FROST PROTECTION.

OWING to the fact that the earliest planting of citrus fruits in the Riverside district were made on lands most easily reached by gravity water, there was a large portion of the earlier planting that was so located as to be especially subject to occasional frosts. At the time of the great Christmas freeze of 1892, the first of a series of more or less severe freezes, this section was severely injured. This was to such an extent that many growers who were carrying heavy mortgage indebtedness lost their entire holdings. At this time the land in citrus fruits was a narrow strip extending below the ditches, for a stretch of something like ten miles, not over a mile wide in any one place, thus forming a barrier to prevent the flow of cold air from extending to lower levels, making the citrus belt much more subject to

frost than it had been at first planting.

This is now largely changed, the large plantings above the Riverside water-level ditches have extended as to be from three to miles wide. The radiation of from the orchards above, as gravity flow of air proceeds, has materially tempered the locality and this land below the ditches is comparatively immune from this of injury to growing crops.

Some Early Experiments.

It was during these years of "scare" that various systematic experiments were undertaken. It was early discovered that running by the furrow system of irrigation was a safe and often sure means of protection.

One of the earliest experiments on a large scale, was with crude oil piped to burners throughout the orchard from oil drums properly placed. It was A. J. Everest who installed this system, and though expensive for general use, paved way for more practical application of the use of direct heat. One of the most serious objections to this system was the immense volume of black, greasy soot deposited on the fruit, houses and, in fact, everything outside, not only the operators' orchard, but adjoining properties. It was so objectionable that suit at law was threatened by neighbors.

Mr. Everest and many others began a systematic study of the temperature variations of our nights. Thermometers were stationed on masts to determine temperature at various elevations. The Hygrometer was employed to determine the relations of the point to our frosts, and air currents were studied. Then much data was collected in a semi-scientific way, which has cast a flood of light on the question as it applies to the interior valleys of the citrus belt in California.

Organized Effort.

Then came the efforts of the Riverside Horticultural Society and its members in an effort to determine the best form of "frost protection." Pretty much everything was tried that had ever been suggested. Literature was ransacked in our own language and the Spanish. The aid of the government observers at San Francisco was invoked. Mr. Everest had built lattice shelter over a large acreage on his ranch to test the value of prevention of radiation by that method. This was found to effect the temperature sufficiently to attain immunity in but extreme cases. But owing to the cumbersome nature of such a structure, it was too expensive to move and erect each season, and the trees did not thrive so well in constant semi-shade.

Smudges.

Smudges were tried as a means of raising the dew point, and also an attempt to form an artificial cloud. For this purpose wet straw was burned in piles distributed in orchards at intervals.

Great vats were constructed with fire boxes underneath to create a cloud of steam. Mr. Priestly constructed a large hopper to be filled with wet straw over a good fire, the whole to be drawn through the orchard on a sled. Messrs. Wright Bros. constructed a steam

er which projected quantities of am into the air.

all of these proved to be of little ue, unless, perhaps, if carried on, a very large scale. The atmosphere s usually so dry at the time of sts in our valleys that all vapor duced is soon dissipated and all ct apparently lost.

Coal Basket.

Mr. Edward Copley created great erest by his experiments with the l basket. It was a wire basket ich would hold about 25 pounds of l, besides the kindling material essary to start it. These were ended in the orchards at the e of from 25 to 50 per acre. They e found to be quite effectual, but these objections. It took much or to keep them burning. They e difficult to light, if the kindling s damp, and it was expensive to ll.

Pots.

ll pots came into favor and were y effective and economical. The ne fault applied to them that did the crude oil burners installed by Everest. It made a vast amount smm

quettes.

hen came the briquettes, a com- ssed combination of asphalt, oil l sawdust. This was found to be s expensive to handle than the l basket, but there was difficulty keeping them burning.

he latest device is a sheet iron ve in which material similar to briquette is burned. This is pped in in sacks, loose, and has ved quite satisfactory. It is the th thing yet produced. It is a lit- ore expensive to install than e others. It certainly does the

California Horticulturally

THE NEW HORTICULTURAL COMMISSIONER.

W. JEFFREY, the newly ap- pointed Commissioner of Horti- culture, has taken possession of office and already commenced ac- e work. Mr. Jeffrey has brought ened experience and a thorough wledge of the requirements of the it growers of the State to his rk, and enters upon it with a mind e from hobbies or prejudices. He e presents one of the greatest indus- es in the State, one in which e is room for great work, and his lity and past record both give omise that the office will be well ed. Mr. Jeffrey has a way of mak- g friends, and already the papers the northern part of the State are ed with favorable mention of him.

PRAYING FOR PEACH BLIGHT.

The season for active work against ach blight has now arrived, and in peach orchards where this disease s manifested itself during the past son, a thorough spraying with the rdeaux mixture, winter strength, ould be made between now and the ddle of December. The fungi ich cause peach blight and shot- le fungus are very nearly related, d the spores are now lodged on the lected trees. These spores send t their roots into the tender twigs soon as atmospheric conditions are vorable, and once rooted it will be ch more difficult to destroy them an at the present time while they e dormant and can very easily be ched.

work with less uncertainty and less labor.

These later methods are all based on the direct heat theory. The cold air being a shallow layer of cold settling down into low places and subject to stagnation and concentra- tion, where air drainage is imper- fect, the aggregation of small fires in the area of greatest danger serves to raise the temperature of this low waste, and the work is done. The elevation tests showed that at a height of say fifty feet, the temperature is from ten to twelve degrees higher. For this reason the effort is simply to disturb this low- lying strata of cold air. Hence, the great value of removing water; the radiation of heat from the water as it comes from the ditches and is distributed through the orchards is considerable.

It Is Practicable.

In conclusion, let us say to the oft- repeated question: "Is it practica- ble?" Yes, it is practicable; it was demonstrated beyond a doubt and has been many times since, that any- one can, with five or ten acres of or- chard properly equipped, protect it from such frosts as we have had in the past. In order to do this, we would suggest that the orchard be kept wet during the danger period, if it is not possible to have running water, and then with forty or fifty of these little stoves to the acre, a perfect immunity can be secured. But it means hard work. It means vigilance. It means sacrifice of night comfort, and it means some ex- pense.—E. L. Koethen, Riverside.

Newly appointed State Horticultur- al Commissioner Jeffrey, left for Sac- ramento last week to take the oath of office and begin his new duties.

NO RAIN IN THE NORTH.

Northern California has had an- other unusually open season, which has been especially favorable for the growers and shippers of table grapes. Usually there is a rain about the middle of September and if this is very heavy much damage is done to the fruit on the vines. For the past two years, however, rain has not fallen until the fruit was all off the vines and shipped, which fact has added many thousands of dollars to the incomes of the vineyardists. This season there has not been even a shower to interfere and shipments of table grapes are still going for- ward, and prices being received are better than ever. From the experi- ence of several years past, table grapes are the most profitable fruit crop now being grown in the State, and there is no reason why they should not remain so. There is a very large and steadily increasing home market, the greater part of which is not supplied, for there are still many millions of people in the United States who cannot get grapes and who remain to be reached. Rail- roads are reaching out and opening new markets each year; improved methods of shipping are being de- vised, and there is every prospect of an increasing demand, while the area in which the best grapes can be grown is comparatively limited. Grape land, too, is still reasonable in price, and the cost of starting a vineyard is much less than that of many other fruits, while it will yield some returns the second year and a paying crop the third. In view of the fact that we in California demand immediate returns for our invest- ments, it is not surprising the table grape growing is now exceedingly popular.

BUTTER MAKING ON THE FARM.

A FEW women are making butter at home instead of sending the milk to the creamery. To these few this article is addressed. In the most of these cases there is too little milk to make it profitable to haul to a creamery. The farmers' wives, I think, in a few years will turn more to butter making for private customers. Creamery butter from the large plants is mild flavored and sweet, but rarely has the bouquet or aroma of the well made butter from the private herd. The private butter maker watches the entire process from feeding and grooming the cows, to the milking and making of the butter until it is in its parchment wrappers ready to go to market. The common farm butter is poor from lack of facilities. Many a farmer's wife would gladly make butter from the milk of a few cows, as a source of pin money, if she was properly equipped to lessen the labor.

Separator.

If possible, have a separator. When more than five cows are milked it is a necessity. Personally, I would have one if I had only one cow. Why? Because the majority of people are accustomed to use separator cream. This is absolutely sweet and fresh, while the lumpy off-flavored cream from pan skimming is very distasteful even when disguised in tea or coffee. Then further, in making butter the pan cream is ripe when skimmed, and it must be retarded or else it develops too far before the butter is made, while with a separator the cream is under good control as to acidity or ripeness at all times. While the separator may not be an economical investment for one cow, yet I am convinced it pays in giving the mother a little more leisure to be a companion of her children. It also saves her strength and may reduce the doctor's bills by giving time for recreation. Recreation means merely creating anew the strength of the human body by rest and change.

Pans.

Where pans are used, the best granite ware will cost a trifle more, but they are easier to handle and keep sweet. The deep setting pan, formerly the Cooley patent but now made in many other names, is not as commonly used in California as in the East. If warm water is put into the can before the milk is added and both are stirred together thoroughly, the success is assured of clean skimming. The can stands in a cool place that makes the cream rise more quickly. The can is kept covered with a double thickness of cheese cloth to exclude the dust. When pans are used a close cover of cheese cloth is made for them. The cheese cloth cover is slipped over a wooden frame made a little larger than the pans so that it will rest on the shelves outside the pans. The cover is made like a pillow slip, open at one end and the frame slips in. Make large enough to take in the height of the pan above the shelves. The shelves are made of two-inch slats and are laid into cut supports two inches apart, and not nailed fast. Made in this way the slats can be removed and scrubbed clean every week.

Cleanliness.

Cleanliness is next to Godliness of course, for it is hard to do duty by anything and not acknowledge Godliness. Whenever we do we seem to be either following first or second commandment Christ: Loving God or our neighbor.

The milk must be clean if butter is to be made. Milking is rarely to be considered a woman's business in California. She however, insist on the milk pails being brought to the house to be cleaned and scalded. Cold water first to rinse out the milk. Then warm water with a tablespoonful of sal soda to the gallon, then the cans after rinsing out the soda water. Use a scrubbing brush with the sal soda and warm water, then rinse with hot water. Fill the can, bucket or pan half of boiling water and cover for ten or fifteen minutes. Empty and stand outside in the fresh air, turned upside down to drain dry.

Ripening.

The cream from the deep setting pans or Cooley creamer is not usually ready to churn at once, it must be set aside in a cool place, stirred down well into the cream jar. The cream from shallow pans is ripe for churning when skimmed during the greater part of the year. It is, therefore, kept cool until enough has been collected. When the cream is in small quantities it would rather churn oftener than allow it to become bad.

Now here is one difference between creamery and dairy butter. Creamery cream is under control as to acidity, while dairy cream is churned when exactly right as to acidity, while dairy cream is not until breakfast dishes or the butter is out of the way, regardless of the fact that it is ready to be churned. The dairy butter starts off in its life career aged, while the cream butter starts off young, in flavor. Gradually the people have come to prefer an almost sweet cream butter, so that gradually the cream comes to be ripe only to the first degrees of acidity, rather than, as far as possible without tainting, lowering of keeping quality follows this in a measure. As the ripening goes on in the butter, the flavor from wrong flavors falls on the consumer, instead of on the producer.

Deep Setting.

The cream from the deep-setting can is stirred together and for twenty-four hours before churning time. No fresh cream. Keep in a cool place, and if the cream does not acquire smooth, satiny appearance of a sharp, sprightly acidity then warm it up to eighty degrees by stirring with a clean bottle filled with hot water, or stand the can in a sector can of hot water. Cover closely for an hour, then taste, and if ripe churn and churn at once. Separator cream takes longer, usually thirty-six hours after the last cream is stirred into the batch.

In adding one lot of separator cream to another, have the temperature the same; this is usually done by letting the cream stand in a can in the same room with the separator ring it into the cream jar.—M. Sherman.

TELLING HORSE'S AGE BY TEETH.

It is an advantage when buying a horse to be able to size up all the points from which the animal's age may be judged, and the surest test is the appearance of the teeth. The following has the endorsement of our veterinary as being all that can be put in print. "The rest," he remarks, "must be learned by experience."

The horse has 24 temporary and 40 permanent teeth, though many mares have only 36 permanent teeth, owing to the lack of tusks. The temporary teeth consist of 12 incisors and 12 canines; the center front teeth, two above and two below, are called central incisors; the next four, are called intermediates or laterals, and the next four corner teeth. The permanent teeth consist of twelve incisors, four canines, and 24 molars. The dental star is a yellowish ring appearing at the enamel on the table or crown of the tooth. The following table shows approximately the changes of the teeth with age:

From birth to ten days: temporary central incisors and three molars cut. From ten to sixty days: temporary intermediate or laterals cut. Six to nine months: temporary corner teeth cut. From nine to 25 months: leveling of temporary corner teeth. Two and one-half to three years: pinchers replaced by permanent teeth. Three and one-half to four years: intermediates or laterals replaced. Four and one-half years: tusks cut. Five and one-half to five years: corner teeth replaced. Five to six years: leveling of lower pinchers. Seven years: leveling of permanent intermediates. Eight years: dental star and notches in pinchers. Nine years: dental star in intermediates. Ten years: dental star in corner teeth.—Farm Stock and Home.

HINTS FOR FARM HORSES.

The grain box should be large, with a flat bottom, so that the grain will fall and not be bolted. See to it that the work collars fit and that they are kept soft and supple. There are few things more discouraging in the beginning of a new season than horses with sore hocks, and this vexation and irritation can be avoided by the exercise of proper care. A well grown yearling is worth more than a stunted two-year-old. The brood mare should have a few hours exercise in the yard or on the road every day. It does not pay to keep her confined. The horses and colts should be kept away from the hens and hogs. The odor of the pigpen is offensive to the horse, and hen lice are hard to eradicate. Never shout at a young horse while training him. Irregular feeding makes thin horses, no matter what amount is given. Keep the colt's feet in good shape. Do not let the toes become too long. Breed only to pure bred sires. Use pure bred dams if possible.

BEET PULP.

Beet pulp has been found to be a very satisfactory feed for dairy cattle. Experiments made by both the actual feeders and the stations show that pulp may be fed to the saving of other feed, especially hay. The feeding value of beet pulp and that of corn silage is practically the same, so if the pulp can be bought for \$2 to \$3 a ton, it makes a very cheap feed. Pulp has a very beneficial effect on the yield of milk, if fed during that period of the year when the flow usually decreases, because of the shortness of the pasture.—Journal of Agriculture.

MOLASSES FOR HORSES.

As an illustration of the advantages of feeding molasses sprinkled on cut hay to horses working hard, the Lawrence Agricultural Company formerly had an expense of \$120 per month for rolled barley; this, by the use of 12 barrels of molasses at \$1.25, or \$15, was reduced to less than half. The hay used was volunteer, cut in April, full of salt grass, weeds and burr clover. An experiment in feeding this weedy hay without the use of the molasses was that about one-half was wasted, making it impracticable to try to use it for a working team. It had been offered for sale at \$2 per ton but was rejected.

The method of feeding is to cut it up with a hay cutter, then to sprinkle it with three quarts of molasses diluted, over 20 pounds hay per head per day, using together with the same about seven pounds rolled barley per head per day.

The result was that the horses, although continuing their hard work, not only held their own, but stood their work better than on grain and are today sleek and in good spirits.

To summarize—The cost of feeding 23 head of horses one month:

Rolled barley hay 4 tons @ \$30.00	\$120.00
Best barley hay 10 tons @ 12.00	120.00
	\$240.00

Molasses combination:

Cost of cutting at \$1.25 per ton	10.35
13800 lbs. Volunteer hay @ \$2.00	13.80
12 bls. molasses \$1.25	15.00
2 tons Rolled barley @ \$30.00	60.00
	99.15

Thus it is seen that the expense is reduced to less than one-half, while the rolled barley still is the greatest expense item. The comparison between ten tons of best hay and less than seven tons of volunteer hay, shows a discrepancy for the reason that the volunteer hay was all eaten when treated with molasses, while even the best barley hay fed dry necessities a great deal of waste. By the use of molasses the volunteer hay was equally as good for the purpose as it was all eaten up clean when the molasses was sprinkled over it. Later, the item of rolled barley will be further reduced and probably cut out altogether.

The principal difficulty in regard to the use of molasses as above illustrated, is that there is such a demand for it in the manufacture of vinegar and denatured alcohol that it is not available during several months of the year.

MOLASSES IN GERMANY.

In other countries people are far in advance of us in utilizing molasses for stock feed.

In Germany, according to the "Scientific American" dried peat is ground and sifted and mixed with molasses in the proportion of 25 per cent peat and 75 per cent molasses obtained in the manufacture of sugar from beets. This product is guaranteed to contain 35 per cent to 40 per cent sugar.

Horses feed with this develop a glossy coat, gain in appetite, and are free from colic. Neat cattle are said to become less subject to foot and mouth disease. The addition of four and four-tenths pounds to the dairy feed of milch cows is said to increase the daily yield of milk about fifty-five-hundredths gallons.

In the province of Hanover from 10,000 to 15,000 tons are used each year, while Germany as a whole, consumes about 200,000 tons, or the equivalent of 33,000,000 gallons.

In this country a perfect substitute for the peat would be leaves from the

alfalfa which shell off in handling, a mixture of molasses and alfalfa in this way in the right proportions would be ideal for cows, horses and hogs, being a highly nutritious and cheap feed taking the place of grain in value, at a very much less cost.

SUGGESTIONS FOR DAIRYMEN.

A good time to do your dehorning is to dehorn the calves with a good dehorner when they are a few days old. Mark them with an aluminum ear mark so you can keep a record of them.

Keep a record of the breeding of each cow, so you will know when she is due to calve, and then allow her to go dry six weeks before calving.

The dairy bull should be fed like a working horse and should receive plenty of exercise. Work him in a tread power.

The milking is one of the most important parts of the dairy business. The cows should be milked quickly, clean and quietly. Do not excite your cows or they will not let their milk down. Don't lick a cow because she kicks. If she kicks there is some cause for it. Look for the cause and remedy it. It may be a sore teat, it may be an inflamed udder, or it may be that she has been misused and regards her milker as an enemy that she must fight. If such is the case, treat her kindly and she will soon learn that you are not going to harm her.

Clip the long hair off the udder and flanks and tail and wipe off the udder with a damp cloth before milking, and you will be surprised to see how much cleaner the milk will be.

Weigh each cow's milk with an accurate scale and test the milk with a Babcock tester and you will be able to see how many of your cows are paying for themselves.—Dr. Roberts, Cattle Specialist, Wisconsin State Veterinarian.

From a financial standpoint it is of the highest importance that farmers should deliver a No. 1 cream of the finest quality and flavor. In order to do this they must deliver the cream more frequently than they have done heretofore. It is impossible for a buttermaker, no matter how competent he may be, to manufacture a high-grade of butter from old, stale, sour cream.—Coleman's Rural.

The trouble is usually with the dairyman when a small dairy does not pay. He misses a cog somewhere. Given careful attention to all the details of his business, cleanliness in his barns and in his utensils, the business ought to pay as well proportionately, with a dairy of 20 cows as with 45.

The proper feeding of a dairy cow is a science but it is a science which cannot be expressed in carefully laid down rules which are to be strictly followed. The judgment of the feeder must always be exercised both in the selection of feeds and in the quantity and proportion to be fed.

Decide on 200 to 250 pounds of butter a year from each cow and if any falls below that standard, sell them as soon as possible. The cow that does not come up to the ideal should not be kept even if she is paying a small profit.

To a considerable extent, at least, the flavor of the butter depends upon the flavor of the food given to the cow.

Strong Harness

If you would have your harness rain-proof, sun-proof, sweat-proof, soft, strong and pliable, use

EUREKA Harness Oil

Makes old harness look like new. Preserves the looks of new harness. Contains nothing to cut and chafe. Will not rot stitches.

To reduce axle-friction to an absolute minimum use

BOSTON COACH AXLE OIL

Superior to castor oil and more economical. Does not gum or corrode. Highest Award World's Columbian Exposition. Sold everywhere—all sizes.

STANDARD OIL COMPANY
Incorporated

MILK CANS ROB YOU

Look through a microscope at milk set to cream in pans or cans and you'll see how they rob you. You'll see the caseine—the cheese part—forming a spider web all through the milk. You'll see this web growing thicker and thicker until it forms solid curd. How can you expect all the cream to rise through that? It can't. This

caseine web catches a third to half the cream. You stand that loss just as long as you use pans or cans for they haven't enough skimming force to take out all the cream. But, just the minute you commence using a Sharples Dairy Tubular Cream Separator, you stop that loss.

Sharples Dairy Tubular Cream Separators have 10,000 times more skimming force than pans or cans, and twice as much as any other separator. They get all the cream—get it quick—get it free from dirt and in the best condition for making Gilt Edge Butter. Caseine don't bother the Tubular. The Tubular is positively certain to greatly increase your dairy profits, so write at once for catalog 1-260 and our valuable free book, "Business Dairying."

Queries and Replies

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.—Ed.

orms.
I have a colt seven months old. I noticed today that it is troubled with worms. I found six or eight long ones out five inches long in manure. The colt is doing well and in good condition. Wish to know a remedy. Subscriber.
Give the colt teaspoonful of pulverized sulphate of iron night and morning in mash for a week. Then give pint of raw linseed oil and one ounce spirits of turpentine to clean them out.—Dr. Oliver.

strawberries.
What are the best kind of strawberries to plant for family use? How often do they need irrigating?—J. W. Riverside.
All things considered, the Brandywine is the best strawberry for southern California, either for market or family use. Two hundred plants (if they have been properly grown,) well cared for, will supply any medium-sized family. Plant in rows 20 inches apart and 12 inches apart in the row. If birds are troublesome set up two boards eight inches wide—one on each side of the row—and cover with cheese cloth or

mosquito netting. The berries will be all the better for the shade of the cloth.—Q. A. R.

Standard Scale.
Please state through the Cultivator if there is a standard weight and measure law in California. Have a Howe scale which does not give same weight as scales in town where I sell my fruit. Grocer claims his scales are correct, but they fall short of weight indicated by my scales. My scales have been tested, but the grocer refused to have his scales tested, claiming they are right. If there is a law on this subject please state where it may be found, and its provisions.—B. P., Redding.

There is an established standard of weights and measures in this State. (See Statutes, 1891, page 487.) A county sealer may be appointed by the Governor or at the instigation of the Board of Supervisors of any county in the State. He holds office for four years. All persons using weights and measures, etc., must have the same inspected at least once a year. Persons using weights and measures without having them certified to as provided by law is guilty of a misdemeanor and on conviction may be

fined not less than \$50 nor more than \$100 for each offense; and the person giving the information necessary to secure conviction is entitled to half the fine.—L. M. Falls.

Juvenile Court.
Will you state in the Cultivator if a decision of the juvenile court is the same as a decision in any other court of law? My neighbor has a son who has been sent to a detention home. His parents need him on the farm and the boy is willing to return and go to work. How can the release of the boy be obtained?—A. B.

The juvenile court is a department of the Superior Court. Its decisions on orders are as binding as any other of the Superior Court. The boy's record in the institution in which he is placed will have much to do with his release. Correspond with the authorities of the institution.—L. M. Falls.

Is Sabbath-Made Contract Legal.
Please tell me if a contract made on the Sabbath is binding. A. called at my house on Sunday and offered me a certain sum of money for my hay and I agreed to take the price named. Later refused an offer to sell at an increase. Now A. refuses to take the hay. There is no dispute as to the character of the hay but only as to price. A. claims the contract was made on Sunday and is not legal.—A. C. Tibbits.

There is no law in this State declaring a contract made on Sunday void. Sundays and certain other days are legal holidays and when any act of a secular nature, other than works

of necessity or mercy, is appointed by law or contract to be performed upon a particular day, which day falls on a holiday, it may be performed on the next business day with the same effect as if it had been performed upon the day appointed.—L. M. Falls.

Distance of Bees from Property Line.
Is there any law in this State regulating the distance which a bee hive may be placed from the property line?—A subscriber.

We know of no State law governing the distance which a bee hive may be placed from the property line. The owner is liable for any damage his bees may do because of any carelessness upon the part of the owner in locating hive.
Los Angeles and other cities by ordinance exclude bees from the limits of the city.—L. M. Falls.

The Superlative Raspberry

Too much cannot be said in favor of the Superlative. It is a red, sweet berry three times as large as any other Raspberry, to my knowledge. It is a continuous cropper from May to November. I counted on one cane 472 berries of different sizes. Just think of a sweet raspberry as large as a Red Logan. Do you know what that means? It means for years to come heavy demand for fruit and plants. Every nurseryman will want a heavy supply. I received 5,000 plants from the introducer in Europe last Spring, and another 5,000 will arrive in November. I offer 2-year-old Plants now at 50c each, \$5.00 per 12, express paid. Going fast.

The Vegetable Garden

THIS MONTH.

CONTINUE to plant peas, lettuce, cabbage, cauliflower, onions, beets, spinach, salsify and turnips. Asparagus roots may be replanted. In frostless sections egg plant and tomatoes may be replanted.

The portion of the garden which is to be planted next spring to the more tender plants may be heavily dressed with coarse manure, which, if plowed under now, will fit soil for fine work a few months later.

But above all plant the peas and other winter growers so that when the Eastern friends call—fresh from the blizzard country—a nice fresh dish from your garden will be a clinching proof that California's climate isn't "so worse."

THE HYBRID CASABA MELON.

Southern California is to be congratulated on its capacity to produce new varieties of fruit. One of the latest is the hybrid casaba melons. It, like nearly all new productions that have unquestionable merits, is a chance hybrid brought into notice by Mr. Samuel Rule. It is a cross between the old winter casaba melon and the early Hackensack muskmelon and, strange to say, it far exceeds either parents in sweetness and spiciness, and is about as good a keeper as the old winter casaba melon and, to cap it all, it grows to fully twice the size of either parent. Its popularity is steadily on the increase. As I predicted last year it is now in demand early in the season. Many people refuse to eat any other variety.

Like all the hybrids it is inclined to run into varieties, one resembling the Hackensack in shape, the other is somewhat elongated, something of the shape of the winter casaba melon. The former is of a dark green, while the later is light in color; the Hackensack is the favorite with most people, being far the sweetest and spiciest.

To Mr. Rule belongs, as stated, the credit for bringing this valuable fruit into general use. He did not try to hybridize the above melons. The winter casaba and the Hackensack grew side by side and the crossing was entirely voluntary. Mr. Rule did not know that he had planted a hybrid melon until the melon began to ripen. Ninety-nine persons out of a hundred would not have had the sagacity to continue the melon. This melon will thrive on poorer soil than the musk or cantaloupe melon. It is hardier and a great feeder, having a powerful root system. It is subject to the same pests as the other melons, as well as the rust blight, although the latter is not so destructive to it. It ripens about the same time as the Montreal muskmelon.—J. C. Ostergard.

CELERY BLEACHING.

The object of blanching or bleaching celery is to secure stalks without leaves and free from too great an amount of woody fiber. This insures crispness and tenderness, with a desirable flavor not found in the plant when it is not blanched. There are several simple methods of blanching, among which the following may be given:

Boards.

Perhaps the most common

method of blanching celery is to set boards on either side of plants as closely to the row as possible. These boards are tacked together by means of bands across top and braced to each other so will be self-supporting. Some dump a little dirt to the outsides of boards to make certain that plants do not get too much light air. These boards should be 10 to 15 inches wide, the most common width being about 12 inches. Any of the cheaper grades of lumber will answer the purpose. This method will be very expensive, as it will take 24 feet of lumber for 12 feet of plants.

Soil.

Still another method and perhaps the cheapest of all is blanching with soil. When the celery is ready to blanch, draw the stalks closely together over the crown of the plants and then draw the dirt on all sides of the stalks, leaving only the top of leaves exposed. Another plan of drawing the stalks together is to wrap the first bunch of the row with twine, then pass a string to the next bunch without cutting or breaking and wrap it around the stalk and pass to the next till all the bunches in the row have been drawn together.

Tile.

W. R. Beattie of the Oregon Station, in a recent circular, describes how tile may be used, in the following language: "Perhaps the most satisfactory way of blanching celery on a small scale is by means of ordinary farm drain tiles of about four inches inside diameter, placed over the plants after they have come almost fully grown. To facilitate the work of placing the tiles over the plants, some of the outer leaves should be pulled away and the main part of the plant loosely tied together by means of a soft string or better, with what is known as per twine, being a string made by twisting a strip of soft paper. This string will lose its strength as it becomes wet, and will offer resistance to the further growth of the plant. The presence of the tiles will cause the leaves to draw above the top of the tiles, thus forming a screen over the top and shut out the light from the interior. If the common unglazed tiles are used the evaporation from their face has a tendency to keep the plant cool during the heat of the day and a very crisp and tender product is the result. This method of blanching is desirable also on account of its cleanliness, as celery treated in this way will need but little washing before marketing."

Straw.

The same authority quoted above says the straw method is rarely attended with good success. He writes: "Another method of blanching is by banking with straw or leaves, but this is objectionable, as the material used generally imparts an undesirable flavor to the stems. The use of any material that is in process of decomposition will cause decay to attack the stems. Common brown grocery paper is sometimes employed for blanching on a small scale by wrapping it three or four times around the celery plants, then fastening it by means of rubber bands or strings. This method is scarcely to be recommended, as the application of the paper is tedious and does not produce a good grade of celery.—Journal of Agriculture.

AY'S First of All

Try It

Matures a week to 10 days ahead of any other known variety; fruits of good size, smooth, solid, bright red color and finest flavor. Although a large number of so-called early sorts have been introduced of late years, on test—side-by-side—not one has equaled First of All for earliness, hardness, size and uniform shape.

The Ornamental Garden

THIS MONTH.

BULB planting should be pushed during this month. The satisfaction given by bulbs is appreciated by few. Most of them are not expensive and reproduce rapidly. Some few deteriorate or "run out," but even these are of such beauty as to be worthy of incurring the loss.

Gladiolus may be planted every month from now till June. That will give a succession of bloom which will give that matchless flower at all seasons.

One of the prettiest of the gladiolus family is the Bride—not one of the largest, but an exquisite little flower perfectly white and a beauty for cutting.

The article on "Growing Bulbs" by O. M. Morris, which appeared in the issues of July fourth and eleventh will be excellent reading at this time.

Early lilies may be planted at once. Frezias also.

Sow pansy seed, stocks, phlox, dianthus, centaureas, etc. Thoroughly mulch the garden with stable manure or fertilizer.

Nearly all annuals may be planted this month. Be sure and get out a long row of sweet peas.

Rake up leaves, weeds, etc., and place in compost heap.

NAMES OF FLOWERS.

It is interesting to know how certain flowers received their names. Many were named after people. For instance, the fuchsias were so called because they were discovered by Leonard Fuchs. Dahlias were named for Andre Dahl, who first brought them from Peru. The camellia received its name from a missionary named Kamel, who carried specimens of this flower from Japan to France. The magnolia was named in honor of Magnod de Montepelier. Other flower names are descriptive. Lady's slipper resembles a tiny slipper. The blossoms of lady's tresses are twisted like a braid of hair. The flowers of the foxgloves are like the fingers of a glove. The name foxglove is said to be a corruption of "folk's glove" or "fairy's glove." Aster means star and received its name from the starlike rays of this flower. Daisy is really "day's eye." Dandelion means lion's tooth. Do you think the name is appropriate for this notched, rather jagged flower?

Anemone means "wind flower." The anemone is so delicately poised that it trembles in the slightest breeze Dutchman's breeches resemble nothing so much as a baggy pair of trousers. Morning glories bloom only in the morning and four o'clocks not until that hour in the afternoon.—St. Louis Republic.

OXALIS.

Oxalis is a plant exacting but little care in its management, and repaying with abundant bloom whatever it receives. It is a perennial plant and can be transplanted at any season of the year, and is always ready to commence a new growth. A single tuber may be potted in a five-inch pot and it will soon require all the space. The plant blooms very profusely and for a long time, although after awhile the foliage and the flowers come smaller and the bloom decreases in amount.

MILDEW.

The Crimson Rambler and some other roses are occasionally subject to mildew. The common remedy is to dust a mixture of equal parts fresh slaked lime and flowers of sulphur, over the foliage, using a porous sack as a dust bag, thus distributing the material evenly and thinly. A liberal dressing of the same mixture stirred into the surface soil about the plant will also prove beneficial in warding off the attack of mildew.

ARBOR DAY.

Ireland is trying to re-establish its claim to be known as the "Island of Woods." It is interesting to know that an American importation, "Arbor Day," is being made use of largely in furthering the ends of forestry.

Since Arbor Day started in Nebraska thirty-five years ago its observance has spread all over the United States. The tangible result in this country has been the planting of over six hundred million trees, for the most part by individual school children, besides the interest aroused in animate and inanimate nature and in forestry. In Ireland a similar movement is now fairly launched and is rapidly spreading throughout the country. The time set for planting trees is in the fall, instead of the spring, as in most American States, viz., the week commencing October 29th of each year.

Last year a circular was issued by the Irish Forestry Society to all the bishops, clergy and public bodies urging them to organize an Arbor Day in the various districts. A hearty response was received, and the support came from all sections of the community, from peers, peasants, clergy and artisans, not omitting the school children.

PECULIAR TREES.

California has one tree which is the personification of mystery. Found nowhere else in the world, it had a mysterious origin and thrives in a region of mystery.

The Mojave yucca is a vegetable freak which has developed into a species. It has the characteristics of several plants, to each of which no relationship can be traced.

It is an endogen, yet its bark shows concentric rings such as characterize the exogenous stems. It lives and thrives in great numbers in a region nearly devoid of vegetation, in a land of heat and thirst and barrenness.

Another tree in California which has a peculiar personality is the creeping oak of Monterey.

Nowhere in the vegetable kingdom can be found so true a representative of monopoly. This tree is of gnarly growth, its limbs, like those of the sycamore, bending and twisting in all directions.

Wherever a branch touches the earth it takes root and becomes, as it were, another trunk, though still a branch of the main stem, drawing nourishment both from the parent stem and from the new source. In this manner the tree is spread till it has taken possession of five acres of ground and it is still advancing.

Most wimmen like tew git a hull lot fur their money till they hap'n tew git inside of a shoe store.

Some men greet you as if they wished their voice were a club.

NATURAL FOREST IN SAN BERNARDINO RESERVE, Cover.
THE GREATEST NEED OF ARID AMERICA, 411.
WITH THE CITRUS GROWERS.—Citrus Trees in the desert; Frost Protection, 412.
CALIFORNIA HORTICULTURALLY.—New Horticultural Commission; Spraying for Peach Blight; No Rain in the North, 413.
LIVE STOCK AND DAIRY.—Butter Making on the Farm; Telling a Horse's Age by the Teeth; Hints for Farm Horses; Beet Pulp; Molasses for Horses; Molasses in Germany; Suggestions for Dairywomen, 414, 415, 416.
QUERIES AND REPLIES.—Worms; Strawberries; Standard Scales; Juvenile Court; Sabbath-Made Contract Legal; Distance of Beets from Line, 417.
VEGETABLE GARDEN.—This Month; Hybrid Casa-ba Melon; Celery Bleaching, 418.
ORNAMENTAL GARDEN.—This Month; Names of Flowers; Oxalis; Mildew; Arbor Day; Peculiar Trees, 419.
EDITORIAL.—To Our Subscribers; Amazing Prosperity for Farmers; Oregon's Plan; Advantage of Underdraining; Will You Send Us A Name, 420.
AGRICULTURAL NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, the Coast, 421.
PROFIT IN THE POULTRY YARD.—American Poultry Association; Around the Yards; Winter Eggs; Gapes; Trap Nests, 422, 423, 424.
CARE OF BEES.—Making Artificial Swarms; Hive Lumber Situation; Birds that Eat Bees, 424, 425.
HOUSEHOLD DEPARTMENT.—No Friends Like the Old Ones; Abel Mitchell's Will; Deserts, 428, 429.
PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Eastern Citrus Markets; Citrus Shipments; Local Citrus Conditions, 430, 431.

TO OUR SUBSCRIBERS.

During the past few years the Cultivator has handled subscriptions through traveling solicitors, and many of our subscribers are expecting these solicitors to call on them at least once a year. Hereafter we shall handle the subscription business from the office, and discontinue our traveling solicitors with the exception of a very few districts in the State, and in that case they will be provided with proper credentials.

The Cultivator is so widely known through out the State that it is not necessary that it should be represented by traveling solicitors. But our 12,000 subscribers can aid us materially in securing new readers by calling attention of new residents and non subscribers to the value of the paper.

The Cultivator has no peer in its line on the Pacific Coast, and we shall depend on the co-operation of our subscribers to extend its circulation and influence. We trust we shall receive suggestions, criticisms and even praise, should it be deserved, and in this way come in closer touch with our subscribers, and be the better able to determine their needs. It is the aim of the Cultivator to be educational, strictly reliable and progressive, and to this end every energy will be bent and every endeavor exerted.

In this connection we wish to say that statements will be mailed to our subscribers as fast as possible showing the status of their account on our books, and while it may be several months before we can reach them all, it is our intention to place the Cultivator on a strictly cash in advance

basis. In the mean time those who are in arrears will do us a favor by remitting their account. The date of expiration is shown on each paper immediately after the name. For instance, John Smith, 10-07, means that his paper is paid to October 1st, 1907.

AMAZING PROSPERITY FOR FARMERS.

The statement is made by several reliable statisticians in the agricultural press that the earnings of the American farmers in 1907 may be greater by many millions than last year. The Orange Judd Farmer of September 7th puts the figures at upwards of one thousand millions dollars, which is corroborated by the Philadelpha Farm Journal.

This is certainly a stupendous showing for the agricultural class in this country, when we reflect that the farm output will be about ten per cent less in quantity this year than last, we wonder where the enormous gain in wealth is to come in 1907. But we must bear in mind that the crop this year is an average for the five years preceding 1907, and with the increased demand for our products the difference in the earnings of 1906-1907 is accounted for. As the Orange Judd Farmer states it, "it is because of decreased quantity and increased price, the leading staples this season will net over \$500,000,000 more to the farmers than last year, while their total gains may be almost twice as great."

There has never been a time when the farmers of the United States were in so healthy a condition, in every way, as at the present time. His real estate has grown in value beyond all expectation. Instead of being a borrower he is a lender. He has more and better stock than he ever had. He has more farm machinery than he ever had and his home is so much improved over past conditions that it vies with his town neighbor in its appointments and luxuries. His children are being educated and his wife dresses better than she has ever dressed. So with the farmer himself. Hence we have a condition, socially, politically, mentally and spiritually which has not existed in the previous life of the American farmer. His future is full of promise.

OREGON'S PLAN.

Oregon is the first State on the Pacific Coast to adopt the initiative and referendum as a Constitutional amendment. Previously, half a dozen States had adopted it, and as many more considered it during the sessions of their legislatures. The plan seems to be taking and is decidedly popular in States whose political policies have been dominated by corporate interests.

As a general proposition the initiative and referendum has many strong points to recommend it to the people. What it is intended to do is to make legislators and other election officials represent somewhat accurately the people who elect them. The contention made by the opponents of the plan that it emasculates legislative bodies like legislatures and City Councils has no basis in fact. It simply makes the members of these organizations more directly amenable to their constituents, and puts in the hands of the people a direct power to remove dishonest or incompetent officials who misrepresent those who elected them. It renders impotent the schemes of corporation grafters to rob the public, and makes redress possible by recalling those who would, by their votes, fasten iniquitous legislation on the people. The Portland Oregonian, the leading newspaper of Oregon, in speaking of the new law adopted in that State says:

"The entire animus of the opposition to the initiative and referendum in this State is the desire of a few millionaire owners of public utilities to dodge their taxes. The representative principle is preserved here and the effect of our system is to make it honestly representative in fact as well as in name. Oregon is not a 'pure democracy.' It is, however, a 'genuine democracy' of the type that President Roosevelt commended in his speech at St. Louis. It is government 'by and for the people,' such as both Lincoln and Roosevelt have praised. Mr. Roosevelt added in that same St. Louis speech, 'the theory of our Constitution is that each neighborhood shall be left to deal with the things that concern only itself,' and that the

average citizen, the plain man whom we meet in daily life, is normally capable of taking care of his own affairs.' If these remarks are sound we think they are, there is very little danger the Supreme Court of the United States will nullify the initiative and referendum laws of Oregon or any other State. They are matters which concern ourselves alone, and they give the citizen the opportunity to take care of his own affairs."

The general proposition embodied in the initiative and referendum we believe to be sound in line with the progressive tendency of the times to secure honest representation from those elected to make laws for and to protect the people.

ADVANTAGE OF DRAINAGE.

The desirability of under-drainage can be summed up as follows:

Under drains remove free water from two or three feet of surface soil thus: Admitting water into the soil; assisting in the decay of plant life; extending the root space; assisting plants to withstand drought; hastening the time for re-vegetation.

Under drains improve the texture, thus: make it possible for root hairs to touch more soil particles; permitting warm showers to sink into soil rapidly.

Under drains cause the soil to be warmer by checking evaporation, using the sun's heat to warm more soil and less water; lengthening the growing season.

WILL YOU SEND US A NAME?

Will every reader of the Cultivator make an effort to send in one new subscriber between now and December 1? This is an easy matter for you and it means very much to us.

"Every American citizen has the right to be protected in his efforts to earn an honest livelihood. No man or combination of men should have the power to prevent him from following his vocation, even by intimidation, for he may have only himself but a wife and children for whom to provide. It is my opinion that the honest laborer who is willing to do work which is proper in no way conflicts with the interests of the community should be given the opportunity to perform it and to have the same protection from authorities which is extended to any peaceful citizen, no matter how powerful or influential. It should be the person or society which opposes him—Cardinal Gibbons in Putman's.

Of more than passing interest to California is the verdict rendered in the Santa Fe rebate case tried in the Federal court at Los Angeles recently. The verdict of guilty carries with it an enormous fine, even at its minimum. It might be as high as \$1,320,000 and it cannot be less than \$66,000. The proceedings go to show the great danger transportation companies invite themselves in when they violate the Sherman anti-trust statute.

"The Cultivator is the home maker's guide for California," writes John Wentworth, of St. Paul, Minn. Rosa.

That puts the status of the Cultivator where it belongs. It is in every sense the "home maker's guide." Follow its teachings intelligently and you will not fail of success.

The America Association of Farmers' Institute workers was held in Washington, D. C., October 23, 24 and 25. E. A. Burnett of Lincoln, Neb., is president and Jno. Hamilton of Washington, D. C., is secretary.

Turkeys and chickens are good scavengers in the orchard, as they destroy many of the insect enemies, and also, eat any fallen fruit, which is often a harbor for protecting and developing myriads of destructive pests.

Making good roads is a good medicine for a tramp. He has worked the roads so long he ought to know just where to hit them to the great advantage.

Agricultural Notes of the Pacific Coast

Northern California

Colusa county, are busy packing and stemming raisins.

Shasta county is to have a new creamery at Anderson.

Olive picking has begun in many of the earlier districts.

The city of Willows has bought land for a sewer farm.

Articles of incorporation have been filed by the Colusa Irrigation Company.

Extensive forest fires did much damage in the range back of Placerville last week.

Most grapes have been shipped and the recent storms will do little damage to vineyardists.

A large tract of land has been purchased near Sisson which is to be subdivided into small tracts.

Glenn county rice is said to yield fifty bushels per acre. One owner has a sixty-acre field planted.

A farmer having land on Sherman Island made the neat sum of \$700 per acre on his onions this year.

Poultry ranchers starting their incubators so early is claimed to be the cause of the high price of eggs.

Thousands of vines will be planted this season in the Sacramento valley owing to the profitable grape year just closing.

Large quantities of cattle are being shipped from Yerka. The cattle are in fine condition from the rich summer pasture.

Two ranchers near Woodland, California, are charged with having started forest fires in order to produce better sheep pasture.

There will be much planting of asparagus to make up for that which was drowned out along the Sacramento river last year.

The Alta-California Beet Sugar Company is signing contracts with farmers of Butte, Glenn and Yolo counties for beets for next year.

Orange picking has begun around Loomis, Penryn and Rocklin four days earlier than last year. The fruit is said to be fairly well colored. The first shipment will be made to Australia.

The State farmers' institute is to be held at Davisville next week. Residents of that section are planning for fine entertainments for the visitors.

Dairying about Dixon is proving to be extremely profitable, and the farmers are being paid in advance of the market price of butter fat by the creamery.

Farmers at Santa Rosa are preparing a good program for the institute to be held in that city November first and second. One entire session is to be devoted to poultry culture.

Owners of large acreage near Maxwell are subdividing the land in five to forty-acre pieces and contracting to give the land to parties who will care for it, and adjacent land for a period of years.

A report of the Suisin creamery shows that for the past year the output of butter from that establishment has been one hundred and ninety-five thousand four hundred seventy-one pounds, and that \$47,471 was paid to dairymen for butter fat.

Central California

Tulare is spraying for shothole fungus.

Porterville began shipping oranges last week.

The cheese factory at Tulare is about to double its capacity.

Watsonville is exhibiting corn stalks eighteen feet in height.

Orange land in Tulare county is said to be increasing in value rapidly.

Parajonian says that Newton pippins are coming in rather wormy this year.

San Jose grange is discussing the question of woolly aphis and peach borer.

A large number of peach trees are to be planted in the neighborhood of Tulare.

The Palm Fruit Company of Wasco is to construct a fruit dryer before another season.

Aromas, San Benito county, is rapidly becoming one of the great apple growing sections of Pajaro valley.

Prof. Anderson reports the quality of the stock exhibited at the Tulare County Fair as being of a very high grade.

The patrons of husbandry of Tulare, Orosi and Dinuba have organized the Patrons' Mutual Fire Association of Tulare county.

Scraper teams are at work in advance of the dredger that is being built on the drainage canal in the Modesto irrigation district.

The loss by fire of the apple drying house of the Pacific Evaporating Company recently caused heavy loss to apple growers whose apples had been delivered.

The Bakersfield Echo says that there is good news for the people of north Kern county, as a large stock ranch is to be cut into small parcels and sold to settlers.

The civic section of the women's club of Bakersfield devoted the afternoon recently to discussing flower raising as a means of adding to the beauty of communities.

A band of 2400 live turkeys purchased in Merced county was driven through the town of La Grande last week. The bunch cost in the neighborhood of \$4000.

A mass meeting was held at Modesto last week when the sum of \$6500 was pledged as a starter for a cannery fund at that point. Twenty-five thousand dollars will be needed.

The California Game & Fish Commission is offering a reward of \$20 for each scalp pelt of the California lion or panther. This is in the interest of the California stock industry.

The citrus fair arrangements of Tulare county seem to indicate a more successful fair than ever. The county supervisors have given a \$1000-encouragement fund, while Porterville donates \$500 to aid Lindsay in making this a great fair.

The Tulare County Times thinks that the weather has been so perfectly fitted to local conditions this year that some San Joaquin valley farmer has at last passed through the pearly gates and has been assigned the task of dealing out weather to that section.

Southern California

Early rains at Hemet have amounted to 1.55 inches.

Ranchers at Hemet are rushing the work of putting in grain now.

Tulare county dairymen are buying cows in Orange county, expecting to take three carloads in November.

Walnut men are getting better organized in their fight against the Anderson-Barngrover Company's patents.

The gathering of walnuts is said to be very economical this year, as nearly the entire crop has been gathered at one picking.

The rain storm, general over Southern California last week, varied from one-half an inch to one and three-quarters inches.

Orange County Poultry Association is planning for its first show. O. M. Robinson is president, and F. H. Holbrook is secretary.

One of the coöperative produce companies in Imperial already has three hundred and thirty-eight acres of cantaloupes pledged.

A Ventura walnut grower drove to the packing house with a load of walnuts last week for which he received a check for \$1300.

Ventura bean ranchers whose beans were not threshed prior to the rains have been greatly injured by the moulding of the beans.

Imperial farmers have met and organized for the coming season's cantaloupe crop. T. P. Banta is president of the organization.

Rain has caused no damage to the walnut crop which is, perhaps, three-fourths gathered. In fact, it has caused them to drop more rapidly.

The San Joaquin ranch in Orange county produced one hundred thousand sacks of beans this season. About equally divided between black eyes and limas.

Orange growers near Highlands are to be able to secure box shooks from the box factory near that place at a much lower rate than the trust has charged this year.

Riverside Press says that the impression is growing that from splits and other causes the orange crop will be lighter than last year.

Members of the California Fruit Growers' Exchange will soon establish a \$500,000 Growers' Supplies Company to produce orange packing boxes.

The Coachella Valley News says: "Coachella Valley is the paradise for hogs and with few acres of alfalfa to turn them into occasionally, much better results can be obtained."

Southern California papers are having much amusement in figuring on the coming orange crop, estimates varying all the way from a very light crop to the very heaviest ever.

The large number of artesian wells near Santa Ana have proved very profitable aids to irrigation in that section, and much money has been made by farmers using artesian irrigating water.

The Orange Height's Fruit Association of Corona have elected the following directors: Jacob Stoner, Frank Thompson, Wm. Sargent, L. A. Fink, A. R. Whitmore, L. R. Nichols and I. H. Moore.

The Coast

Hay in central Alaska is now commanding from \$200 to \$300 per ton.

Utah College people are planning for the greatest institute season ever for this fall.

The annual fair of the Grange at Oregon City, Oregon, eclipsed any previous display.

About fifteen thousand sacks of grain is the daily receipt at Wash-tucna, Washington.

Apples at Garfield, Washington, brought the owner a total of \$11.60 per tree for the entire orchard.

Farmers near north Yakima have worked together in buying hay balers which has proved very profitable.

The Hood River, Oregon, fruit growers are organizing for the purpose of better marketing facilities.

The high price of camphor is causing extensive plantings of the camphor tree on many islands of the Pacific.

The greatest crop ever raised in the Flathead valley near Whitefish, Montana, is said of its potato yield this season.

Nearly all barley in Oregon, at least in portions near Portland, have passed from the hands of the producers.

Official statement is made that the Burmuda onion crop of Texas this year will bring a net profit to the raisers of \$840,000.

The export of \$7,000,000 worth of ostrich products from South Africa would indicate possibilities for that industry on the Pacific Coast.

Stockholders in the co-operative creamery at Palouse at a recent meeting decided that the co-operative venture had been a complete success.

Farmers' Institutes in Washington are to be conducted November 1st at Angeles, November 2d at Seguin, November 4th and 5th at Quilcene.

Public stock sales near Pullman, Washington, have resulted in exceedingly high prices for dairy cows. One entire lot sold for an average of \$69.

Amongst the chief exhibits in the Montana county fairs this fall has been the products of non-irrigated land, or the so-called dry farming products.

It is suggested that the cotton growers of Texas be forced by legislative action to stop planting cotton in infected sections until the weevil has been exterminated.

In a dry farming contest at the Interstate Fair held at Spokane recently the prize was taken by a farmer who produced one hundred pounds of potatoes in twelve hills.

As great as Colorado is regarded as a mining center with its yield of eighty millions of dollars from the mining industry, it received an income of one hundred and twenty-five millions from agricultural products.

The bankers of Texas have agreed to stand behind the cotton growers and advance them money to aid them in holding the cotton crop, so as to stand off the cotton speculators who are combined on a low price campaign.

The first opening of land under the Carey Act in Colorado occurred September 5, when the Little Snake River valley, in Routt county, was thrown open. The area comprises some 50,000 acres, which will be watered by a canal dug by the Routt County Development Company of Denver.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Hap-hazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledge standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis World's Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Filcher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Beef, Blood and Bone Will Make Your Hens Lay

This is not a medicine but a high grade nitrogenous food. Write for free booklet "How to make Hens Lay." Our Poultry Foods are sold by all local dealers and manufactured solely by

The Pacific Guano and Fertilizer Co., Indiana and Yolo Sts., San Francisco, Cal.

Also Pioneer Manufacturers of High Grade Fertilizers. Write for our free booklet, "Farmer's Friend." Valuable to all farmers and ranchers.

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed, management, disease and its prevention will be answered through these columns.

AMERICAN POULTRY ASSOCIATION.

AT A meeting held in Los Angeles recently, a branch of the American Poultry Association was organized. Perhaps many of our readers are not familiar with the American Poultry Association and its objects.

This association is to the poultry industry what the National Live Stock Association is to breeders of live stock. It has done more for the advancement of pure bred poultry than any other, or perhaps than all other clubs and organizations that advocate standard bred poultry. While we believe in specialty clubs and think they advance and perfect the different breeds, yet when the general interest all along the line is advanced, it is generally through the A. P. A.

Every show held in the United States and Canada is governed by rules laid down by this Association. The Standard of the different breeds was made by it, and from this Standard the judges get their instructions for judging.

Illustrated Standard.

At the last meeting held at Niagara Falls in August, the Association decided to issue breed standards, or separate standards for each recognized breed. This Standard will contain illustrations of the male and female, printed in the natural colors, and will describe each section of the breed. In fact, will give all information that is desired of the breed. The illustrations will represent what an ideal or perfect bird should be, and will give more of a general description than the present standard.

Several years ago when the A. P. A. decided to issue illustrated standards, many said that the Association could not afford to issue at a cost that would permit the average breeder to have one, but the sale exceeded any previous edition. We believe it will be the same way with the individual breed Standard.

Branch Associations.

The object of branch associations is to work the local field, secure new members, find what the needs of the breeders are, and recommend that the general association act on same. Each is also allowed delegates to the annual meeting. We understand that it is the intention to furnish lectures for farmers' institutes, thereby giving the breeders a chance to hear the best and most successful engaged in poultry culture.

The life membership fee is \$10, with no dues and no assessments. Half of this money remains in the treasury of the branch association and can be used in paying expenses to the annual meeting.

California Representation.

Not many years ago President Holden and Secretary Orr came to California and organized a branch of the association, making many promises as to what the association was going to do for our State. Well, we still have these promises coming to us.

At the last election, California put up as good a man for a member of the executive committee as was on the

list, yet he was not elected. Yet feel that we will have a representative some day, for our friend Miller Davis, who is a member of the board, promises to move to California some time in the dim and distant future, until that time we will have to be content with our one branch of the association. However, California never did run much to "politics" and the breeders are willing to forget the past and are determined to have one of the best branches of the association. I propose to have such a large show at the next election, that some of our friends on the other side of the divide will sit up and take notice.

AROUND THE YARDS.

When fowls are confined in yard feed liberally of green food.

Pullets should be well matured and mated to a vigorous males, for best results.

A successful poultryman says that his eggs cost most when his hens are fed on too exclusive grain diet. To reduce the cost, he fed liberally shell, cut alfalfa, bone and vegetable

To be successful you must use your head as well as your hands.

Filling the water fountains, grit and shell boxes when you feel like it do not add to poultry profits. It's doing the things when needed that counts.

Take lessons from the older and more experienced poultrymen. They know some things you have yet to learn. But don't be afraid to do some experimenting on your own account.

The young poultryman should not be discouraged by temporary failure and disappointment. He should take courage in that those enjoying success were one time where he is today.

The lessons we seem to pay for the dearest are, after all, many times the most profitable lessons.

Scalded poultry is best for private local trade.

Feeding skimmed milk has a tendency to whiten the flesh.

Games crossed make better table poultry than do the games in their purity.

Dry-picked poultry will stand longer shipment than will that which is scalded.

The flesh of the fowl is as easily tainted with bad food as is the contents of the egg.

Epicures will always prefer fresh-killed poultry to that which has been placed in cold storage.

Fowls should be dressed immediately after being scalded, even when the scalding method is practiced.

There is not enough profit in the cramming system of fattening to warrant the practice being followed in this country.

Greasing eggs to make them shine is a bad practice. Grease fills up the

pores of the shell, and quick decay is the result.

Good management is the secret of success, and bad management is the cause of the so-called "bad luck." There is no such thing as "good luck" and "bad luck" with poultry; it is all in the management.

The presence of the tapeworm in turkeys may be noted by a droopy condition of the afflicted birds; small portions of the worm will also be found by careful examination of the voidings. An authority says powdered male fern is an effective remedy for tapeworm.

The introduction of the trap nest in the hen house will at once point out the fact that every flock has one or more drone hens in it—"robber hens." Weed them out. They are not only unprofitable in themselves, but they consume the feed and take up the room the good hens should have.

While certain breeds are more inclined to yellow skin than others, the fact remains that even naturally yellow-skinned fowls can have the color of flesh changed by feeding accordingly. Corn and cornmeal is the proper food for producing yellow carcasses while fattening, while buckwheat has a tendency to whiten the skin.

Exercise good common sense in the management of poultry, bearing in mind that it is usually some little detail, something rightly attended to at the proper time or carelessly left undone, that turns the scales either to the side of profit or loss. Nothing will bring success so quickly as intelligence and faithful attention to all the small matters.

Please tell me how to rid chickens of fleas, more like a tick or a combination of both, that gets on chickens' heads. What effect will it have on the chickens and how can they be gotten rid of?—A. Subscriber.

Fleas on chickens are quite annoying, but can easily get rid of them by spraying your house with an emulsion of distillate and crude carbolic acid. For birds that are affected, apply salve, or lard and sulphur.

What is the cause of limber neck, and is there any known cure for it? Have lost three with it; do what I would I could not help them. Other diseases I have had a fair degree of success with.—Mrs. M. F., Anaheim.

You should first look for the cause and remove it. We believe you can easily locate it if you look. The disease is caused by birds eating decayed meat or maggots; it is also caused by hot weather, but at this season it is not so apt to be caused by heat. Remedy: One teaspoonful of hyposulphite of soda to each quart of drinking water. When trouble is first discovered give one asafoetida pill the size of a pea.

THE REASON.
"My son is going to be either a great financier or politician."
"Does he take an interest in such things?"
"No, but he's got to make a living somehow, and he just won't work."
"Bilkins tells me he is getting awfully tired of living alone. I would think he'd marry and settle down I was talking with him about it the other day, and he says he doesn't know whether to get married or buy a phonograph."—Milwaukee Sentinel.

WINTER EGGS.

If winter eggs are desired, it is of much importance to have the hens shed their feathers as early as possible, so as to be enabled to get their new feathers fully grown before the cold weather begins. In case molting is much delayed, the production of the new coat of feathers in cold weather is such a drain on the vitality of the fowls that few eggs are produced till spring. While, if the molt takes place early in the season, the fowls begin the winter in good condition and with proper housing and feeding may be made to lay during the entire winter. To help the hens to an early molt, withhold food either wholly or in part for a few days till the feathers begin to drop pretty freely, then feed heavy on a ration suitable for the formation of feathers and the general building up of the system. Lots of green cut bone and meat scraps in addition to their grain ration is good for this purpose. Mature hens, when fed sparingly for about two weeks and then receive a rich, nitrogenous ration, molt more rapidly, and with more uniformity and enter the cold weather of winter in better condition than similar fowls fed continually during the molting months on egg-producing ration. Bone food, warm mash and plenty of scratching litter are the important things, after getting them over the molt; and with care, any farmer's wife can enjoy the luxury of winter eggs.—Kansas Farmer.

GAPES.

Gapes among chickens is a difficult disease to overcome, but some remedies have been found to be quite effective. Wheat soaked in turpentine and fed to gapey chicks has been found to give relief. In addition to this, sprinkle air slaked lime on the bottom of a box and put the chicks into it. Inhaling the lime will cause sneezing, which will in turn cause the gape worm to be ejected.

It also might be a good idea to sprinkle the air slaked lime about the ground on which the chicks are accustomed to run. Moth balls are perhaps as good for a disinfectant as anything you could use. They should be sewed up in pieces of old cloth about six to a bag.

Just what causes the gapes is a disputed question, but a good disinfectant will do no harm and may do considerable good. Cleanliness is another thing which should always be considered, especially in relation to pure water.—Farm Progress.

Now is the time to look over the chickens and separate the culls from the breeders. All cockerels not to be sold or kept for that purpose, as well as such pullets as do not come up to the standard should be fattened and sold. If one cares for the beauty and uniformity of the flock, discard all that are off in color of legs or plumage as well as those which show abnormal characteristics of any kind. This weeding out process will leave more room for those remaining besides bringing in as much money as though the birds were fed longer, for with the increase in weight of chickens, there is a decrease in price per pound which makes it unprofitable to keep them longer than is absolutely necessary to grow them large enough for table use.

GOOD INVESTMENT.
I am much pleased to subscribe for your paper and consider the investment of \$1.00 per year a good one.—H. L. Granger, Fresno.

50 Cent Eggs

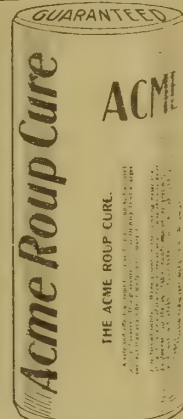

You may feed grains alone until doomsday and you will never get many of them. You must supplement grains with some highly nitrogenous food, rich in protein, to keep the hen in good health, build up her system and furnish her with the material for making eggs.

Egg-More

is just this and nothing else. It is not a strong tonic and stimulant, but contains enough condiments to give the food relish and keep the fowls in fine fettle. Just a little fed daily with good grains, or even with bran will do it. It can be fed either dry or as a mash. The hens like it, they eat it, there is no waste. It makes the very cheapest Egg Food, especially if you can buy your grains at home cheaper than to ship them in. The cost is but a very small per cent of the increased egg production. 4-lb. package, 35 cents; 25-lb. pail, \$2.00; 50-lb. sack, \$3.75. If your dealer doesn't keep it, we will deliver a pail or sack freight prepaid by us.

At G. A. Prices

For the two weeks beginning Nov. 4th, we are going to cut prices regardless of cost. We call it our G. A. sale. That might mean Great American, but it doesn't. It simply means that we want to Get Acquainted. We have a fine, large store, full of first-class goods, and we are making this sale so that you can't afford to stay away. Just look at these sample prices and see if you can.

Beef scraps 7 lbs. 25c 3.00 Cwt
None better made—carload on the way.
Meat Meal 7 lbs. 25c 3.00 "
Blood Meal 6 " 25c 3.25 "
Willow Charcoal 6 " 25c 3.00 "
Clam Shell 20 " 25c 1.00 "
Oyster Shell ... 16 " 25c 1.25 "
Granite Grit .. 25 lbs. 25c .80 Cwt
Alfalfa Meal ... 16 " 25c 1.25 "
West Coast Egg Food .. 10 " 25c 2.15 "

Some Egg Foods are sold per sack which vary from 75 to 90 lbs. Get 100 lbs. in yours.

West Coast Scratch Feed 10 lbs 25c; 2.10 Cwt.
West Coast Fat Food 9 lbs. 25c; 2.35 cwt.
Egg-More 4 lbs. 25c; 1.60 per 25-lb. pail.

The biggest seller on the market today. If you haven't tried it you ought to, and this is your chance

The above prices are but samples of our cut rates. The prices of everything in the store are cut in the same way. Come and see. Or if you can't come let's Get Acquainted by mail. Don't forget that there is none better than the IMPROVED PACIFIC INCUBATORS, and they are included in this sale. We shall keep open store until 9'clock, Tuesday, Thursday and Saturday evenings during the sale. Come and see us.

Care of Bees

MAKING ARTIFICIAL SWARM

WE HAVE not yet learned how to prevent swarming, but can do the next best thing, can swarm the bees when we ready, and thus do away with the certainty attending the matter left to the bees entirely. What do with the combs of brood which the bees have been taken now a solved problem. We get them to weak colonies, or put them on top of the swarm. I have for number of years practiced shaking bees off their combs at the approach of the basswood honey flow, and must say the plan is all right, practically cures the swarming that season; in fact, is as good a cure as swarming itself, writes F. A. E. man, in Coleman's Rural.

But there are several things to be taken into consideration when making the plan. First, we ought to wait until queen cells are under way, for, if we do not, such a colony will not swarm nor offer to. We are much ahead in saving labor, though it can be done if the hive is very populous; but we must be very careful to cause the bees to fill themselves with honey. The following is my method for making swarms. For instance, if a colony is examined and we find queen cells started, a hive is prepared with start. About six frames is the number I use, but never more than seven. Now we find the queen and set the frame she is on to one side. Before the colony should be smoked and handled somewhat roughly so the bees will fill themselves with honey. Next we take a newspaper and spread it down in front of the entrance to the new hive, for you will be in shaking the bees off, shake a little of their honey onto the mass of bees in front of the hive and, unless the place is very clean, many bees will become so daubed up as to perish hence the necessity for using a paper.

Shake most of the bees off the frames close to the entrance. Use little smoke so they will run quickly and clean themselves with honey in the hive. Now take the frame the queen is on, pick her up with the fingers, or take a piece of glass and scrape her off the comb down close to the entrance and that she goes into the hive. I do not know why it is, but queens seem to find it harder to get into the hive with these swarms than at any other time. If there is a hole or any other access in sight which they can get into instead of going in at the entrance they seem bound to do it. I do not place the old hive and combs on top of the swarm, and in ten days the bees are again shaken down in front of the swarm. They can be shaken clean now, and the combs of old brood can be given to nuclei, or used elsewhere, as one wishes.

The beauty of the whole thing is we have the swarming problem under our thumb. Look over the hives once a week during the swarming period. If a colony shows queen cells it is safe for another week. If the bees have them under way, shake them and there you have it.

I find that this method has several advantages over natural swarming. In the first place, we do not have to watch for swarms a great part of the time and, where our apiaries are run, a great saving

TRAP NESTS.

Trap nests are built to tell you which hen laid the egg, and how many eggs she lays in a given time. Of course, where the hens lay in the haymow, weeds and anywhere you cannot follow them up with trap nests very well, but where you provide laying houses and plenty of nest boxes you can surely, with one or two hundred hens, pick out enough to start a laying strain with.

The old barnyard fowl averaged about 36 eggs in a year. In government reports every hen now is listed with an average of 75 eggs per year. But to make up the average in any flock bunched together at random, a few hens must do nearly all of the laying.

Those who have used the trap nest system of discovering the hens that lay the eggs, made some discoveries. They found hens that did not lay six eggs in a year, and others that did not lay twenty-five, while others range from 125 to 200.

A great milk cow may not produce cows quite her equal in milk-giving powers, but it is from her we make choice of future cows. Hens of great laying powers go the cow one better, for in nearly every case they produce hens their equal, and not only this, but transmit the laying power through the other side, male birds of such mothers being used in building up a laying strain.

Trap nests are dear, but in buying half a dozen or a dozen you get a big per cent off. Then I notice a firm once in a while advertising the trap, you making the wood part of the nest yourself. This makes it cheaper. One handy with tools can make trap nests himself.

Enough could be used to pick out at least twenty or more hens that lays 125 or 150 eggs a year and these in turn could be marked with numbered leg bands to start another year with an egg-laying strain of your own. Egg-laying contests the world over have shown that it is not in the breed, but in the strain of any good breed that you get the great layers. Better keep that kind than a hen that lays but six or twenty eggs.—Ida M. Shepler, in Successful Farming.

ie result. More honey is obtained, because of the swarming is done at the commencement of the honey flow, the bees being brushed on frames with one-half-inch starters with an excluder on. Supers are given filled with drawn combs and the bees simply have to store them, as they have no other place to put the honey.

The honey is also capped whiter. As you well know, we get whiter capped sections over newly built combs, consequently the honey will bring a better price. If one wishes for some increase, there is no nicer way than to give a ripe queen cell to combs of brood. When the queen is ready to lay she will find empty cells, and the colony will be in fine condition for the autumn flow, or for wintering. If hived comfortably and in a suitable place to work, there will be very little difference from the natural way.

HIVE-LUMBER SITUATION.

Beekeepers have been greatly exercised for some time over the high price of hives and other bee supplies made of wood, and some have flattered themselves that in time prices would come down. There does not seem to be much hope for this consummation; on the contrary, all signs point the other way for, according to a recent bulletin issued by the Forestry Bureau at Washington, we are using up the white pine forests at least three times as fast as we ought to, though at present we are using only half as much as we did in the latter eighties.

At the annual meeting of the Northern Pine Manufacturers' Association in Minneapolis, January 22, 1907, the secretary J. E. Rhodes, made this statement:

"Since 1895, 248 firms, representing an aggregate annual output of pine lumber of four and one-half billion feet, have retired from business, due to the exhaustion of their timber supply. Plants representing approximately 500 million feet capacity which sawed in 1906 will not be operated in 1907." It may be argued that we might use some other lumber—for example, cypress or Douglas pine; but this would hardly help us, for the freight rates on either are very high, as one is produced in the extreme South and the other in the extreme Northwest.

Of course, we might use substitutes; but, unfortunately, these are dearer in the end than good white pine. It must be borne in mind, also, that beekeepers demand the very best lumber in their hives.

Luckily the ordinary beekeeper uses only a small amount of lumber each year.—Gleanings.

BIRDS THAT EAT BEES.

A British beekeeper writes: Having read about birds, when catching bees for food, carrying off drones and not workers, my interest was aroused in the question of birds and bees, and I shot several birds seen flying about my hives one day when bees were on the wing, but none of the birds killed, including swifts, swallows and martins, showed any trace of having captured bees, either workers or drones. I found lots of small flies.

Twice this year I have watched the common house sparrow snapping up bees. I drove off the little marauders before giving them time to devour their prey, and in each case the bee's head had been bitten off by the bird before eating the body.

Coulson's

No. 3

Condition Powder

FOR POULTRY

If you are not already using COULSON'S NO. 3 CONDITION POWDER, we would suggest that now is the time of year when your hens most need a tonic, to get them into condition after a heavy laying season. If you neglect them now, and they go through the molt in poor condition, it is likely to take them a long time to start laying again, with consequent loss to your pocket.

WE CLAIM

COULSON'S No. 3

Condition Powder

will put the flock in good, vigorous condition, not only enabling them to withstand any possible infection or disease, but enabling them to go through the molt rapidly, and to commence laying again before the cold weather sets in. We practice what we preach, by giving our own hens a little of Coulson's No. 3 Condition Powder three times a week, and although they are beginning to molt heavily, their combs are as bright and red as at the beginning of the season. You will find that it does the same with yours if you give it a fair trial. It will not only do this, but will enable the hens to digest a much larger proportion of their food and thus save your feed bill considerably. Therefore, if you wish to make money this fall and winter, inquire right now at your dealers for Coulson's No. 3 Condition Powder, and see that he keeps a stock so that you have it when you want. Where the local dealer does not keep it, we will make you a SPECIAL OFFER to deliver it freight prepaid to any Railroad Station in California, at the following prices:

10-lb Package, \$1.50; 25-lb Package \$3.25;
50-lb Package, \$6; 100-lb Package, \$11.

Prices prepaid to R. R. Stations in Oregon, Washington or Nevada will be: \$1.75, \$3.50, \$6.40, \$11.50 respectively.

NEED OF ARID AMERICA.

Continued from First Page

brush land and government engineers may erect the finest of structures for the storage and diversion of irrigation water, but all these will prove expensive luxuries without the co-operation of the strong arm, sound judgment and tireless energy of the agricultural classes.

This brings us face to face with the weak feature of every plan yet adopted by the American nation for the reclamation of its arid lands. It also forces upon our attention the great task yet to be accomplished of reclaiming and planting five million acres of worthless desert. Before any harvest can be obtained on this new land it will cost on an average over \$20 per acre. This represents \$100,000,000. Now, neither the Carey Act nor the Reclamation Act provides for any competent supervision in the expenditure of this sum. The preparation of the soil, the construction of ditches, the selection and planting of crops, proper cultivation and irrigation are to be handed over to inexperienced settlers.

Again, the settler is forced to do this work and expend his small savings at a time when he can least afford it. His farm is still a desert. The best crops require from one to five years before yielding any profits. First year alfalfa never made any man rich, small fruits bear the second year, grapes and trees the third year. The heaviest expense comes at a time when there is little or no income. Do you wonder, then, that the weak link in our much boasted schemes of irrigation snaps under the strain, leaving a farm tenantless, a home abandoned?

Perhaps I can convey a clear idea of the assistance which might be given to new and old settlers alike by a brief reference to work recently done in California. Four years ago the California legislature provided for the joint investigation with several branches of the Federal government of the water and timber resources of the State. A part of the investigations was to consist of some of the difficulties with which farmers in irrigated districts have to contend, and was placed in charge of the United States Office of Experimental Stations. It has been my good fortune to have been connected with this work since its inception. The scope of the investigations has included the operation and maintenance of canal systems, the equitable distribution of water among users, the building of farm ditches, the preparation of land to receive water, the prevention of waste, the cost of pumping water, the drainage of irrigated lands, the effect of water on crops and the various influences and conditions which tend to retard or advance the interests of rural communities in irrigated districts.

A part of this work was new, and in its execution mistakes have been made; but the people of California have been indulgent and all classes have been willing to assist whenever an opportunity presented itself. I have not heard a single word of criticism or a doubt expressed as to its value.

How Settlers of Irrigated Farms May be Assisted.

This attitude on the part of the people of California has led me to offer a few suggestions to this Congress regarding the proper measures

to adopt to guard against the failure of irrigation enterprises bringing timely assistance to those upon whom rests the tremendous responsibility of paying for both land and water, and of making both profitable. Give one of this work class from three to five years to get his land in shape, fences built, ditches dug, building erected and profitable crops started, and he will be prepared to meet all reasonable obligations. A few years later he may have a large bank account. Do not place the same burdens on the settler of limited means at a time when he is spending both time and labor on improvements, with little or no income, and the chances are you will crush him.

One of the suggestions I have to offer is that the settler for the first and second years of his occupancy be relieved of all payments on both land and water. Instead, he should obligate himself to improve his holding to the extent of a fixed sum per acre each year. Canal companies that control both land and water and contractors under the Carey Act should afford to grant this concession. Government projects if the time allowed to pay for a water right cannot well be extended to twelve years there should be adopted a sliding scale of payments.

Another suggestion which I have to present is some measure of relief for the new settler from the burden of taxation. A few Western States levy no taxes on grapes and fruit trees until they bear. This exemption should be extended as far as is safe and practical to every immature crop and to every Western State and Territory.

Communities in newly reclaimed districts can likewise be assisted by the use of sufficient capital to establish such industries as canneries, creameries, etc. These should be organized on the co-operative plan such a way that the farmers interested will in time become the owners. Poor settlers are not able to start these industries and for lack of them their tomatoes and other vegetables are fed to stock and the dairy products cannot be marketed.

The Off-Horse.

But none of these means of assistance touches the vital part of the irrigation question. That part is simply this: Five million acres will soon be ready for settlement. An outlay of over \$100,000,000 is required before homes can be established and crops marketed. Who will supervise the expenditure of this vast sum that it may be put to the best possible use? If it is right and proper to employ the best engineering talent to design and supervise irrigation structures, the same necessity exists to employ men of equal skill to supervise that part which belongs to the agricultural side of irrigation. A teamster cannot bring his load to market if one horse drops by the wayside. In every irrigation undertaking the farmer is the off-horse and no venture of that kind can succeed unless he does his part.

If this view be correct, fully a thousand skilled men could be profitably employed under the more recently built irrigation systems. These men should be familiar with all the details of farm work and irrigated culture and possess sufficient engineering and scientific knowledge to enable them to direct

Cream Separators, all sizes, all prices. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

For Mehring Foot-Power Milking Machines see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles, Cal.

id supervise the work of converting a desert into a highly productive irrigated farm. Canal companies, irrigation districts, State and Federal governments should share in the expense of maintaining this force.

Will be a Good Investment.

I leave to abler men the task of formulating plans for the most efficient organization of this force. That I particularly desire and advocate is the enlistment of every useful agency in support of the homesteaders. These agencies may work independently of each other or they may work in co-operation. Canal companies, for example, may employ their profit to their shareholders and hire men to direct the labors of experienced settlers. This kind of assistance has been given under Carey Act projects in Idaho and its value has been fully shown. The conversion of five-dollar grazing lands into one hundred-dollar alfalfa land and five hundred-dollar orchards is of vital interest to every Western commonwealth and each can afford liberal appropriations to help those who produce such changes. Reliance must also be placed on Western States and Territories to maintain in the highest state of efficiency the irrigation work of Western experimental stations. The small sum which is annually appropriated by Congress for this purpose is not enough to maintain a dozen lines of investigation, and too frequently the funds which should be given to this basic industry are devoted to less important subjects.

Dr. Mead has spoken of the irrigation work of the Department of Agriculture. As a member of that staff, I may be permitted to state that the field has always been so large and the problems so numerous that we have not been able to cover more than a small part of the total irrigated area. The demands of the old settlers under irrigation have taxed to the utmost the energies of our small force, and now a new difficulty is presented. The new as well as the old settlers are clamoring for advice and assistance. Instead of 11,000,000 acres to look after, there will soon be 7,000,000, and we have neither the means nor the men to meet this demand.

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfits. See O. J. Weber Co., 555-557 S. Los Angeles Street, Los Angeles.

The Silver Lining.

One word in conclusion. In directing your attention to what seems to me to be the greatest need of arid America I have been obliged to present the dark side of the picture. I hasten to assure you this course has not been taken in order to discourage settlers, but rather to aid them. I believe so thoroughly in irrigation and in the advantages of irrigated agriculture that I would not attempt to cultivate land outside of the arid region. I feel certain that in no other part of the United States can the staple products of the soil be so cheaply grown. In no other part of the country is the soil so rich, the climate so agreeable and so well adapted to the outdoor occupations of men. It is because of this abiding faith that I so earnestly desire the success of all irrigation enterprises. The strong features of these need no words of praise from me; it is the weak features which cause us to fear, and since a chain is no stronger than its weakest link, I urge upon you as the representatives of the people of the West to come to the rescue and change a possible defeat into a glorious victory.

In all the greatest battles of the history of the world the wise general has reserved a part of his force to use at critical periods in support of the weakest positions. In this great battle against aridity which is now being waged the weakest position is to be found on the firing line amid the thickest of the fight, among the great army of toilers who are striving to conquer with water the Great American Desert.

The Farmers' Institute was held at Corning Oct. 14, 15 and 16. Prof. Warren T. Clarke of the Yale University, G. B. Lull, State Forester and A. W. Robinson, of Napa, were the principal speakers. The attendance was large and interest great. Corning conditions of soil, climate and what best adapted to it, were made the special subjects.

Corning has over 2000 tons of prunes in storage.

A Santa Ana planter is putting out a number of "sweet olive" trees, which, it is claimed, make exceedingly fine dried olives.

For practical cow milking machine see O. J. Weber Co., 555-557 S. Los Angeles St., Los Angeles.

KEEN KUTTER TOOL CABINETS

It is difficult to select a set of tools for the home or farm piece by piece that will exactly cover all requirements. To save the expense of needless tools and always to be sure of having just the tools necessary, select one of the Keen Kutter Tool Cabinets. Then you will have as good a set of tools, kept in as good condition, as the expert tool user.

Every tool belongs to the famous Keen Kutter brand, and is sharpened, tested, inspected and guaranteed perfect before it is sent out.

Keen Kutter Tool Cabinets are the only ones made containing a set of tools under one name, trademark and guarantee. Prices from \$8.50 to \$85.00. If not at your dealer's, write us.

NO FRIENDS LIKE THE OLD ONES.

There are no friends like the old, old friends,
And none so good and true;
We greet them when we meet them,
As roses greet the dew.
No other friends are dearer,
Though born of kindred bold,
And while we prize the new ones,
We treasure more the old.

There are no friends like the old, old friends,
Wherever we dwell or roam;
In lands beyond the ocean,
Or near the bounds of home.
And where the smile to gladden,
Or sometimes frown to guide,
We fondly wish those old friends
Were ever by our side.

There are no friends like the old, old friends,
To help us with the load
That all must bear who journey
O'er life's uneven road.
And where unconquered sorrows
The weary hours invest,
The kindly words of old friends
Are always found the best.

There are no friends like the old, old friends,
To calm our frequent fears,
When shadows fall and deepen
Through life's declining years.
And when our faltering footsteps
Approach the Great Divide,
We'll long to meet the old friends
Who wait on the other side.

—Deaf Mutes Register.

ABEL MITCHELL'S WILL.

ABEL MITCHELL called to his typewriter.

"You may go, Miss Morris," he said. He did not look up from the papers before him.

The young woman turned to the clock with a little start of surprise. It was only 4:30. But she quietly put on her hat, and with a murmured good night left the room.

Abel listened to the departing rustle of her skirts with a thoughtful expression. There was a sensible girl. A girl who had never grated on his feelings. A girl who asked no useless questions. She had reached an age of discretion. If Jim was determined to marry a poor girl, why couldn't he have taken one like Emma Morris?

Abel opened a heavy envelope and drew forth a folded paper.

"Jim was never confidential with me," he grumbled. "Perhaps I didn't invite his confidence. I don't know. Now he has disobeyed my direct command. That can't be overlooked. When he told me about this girl I said, wait. 'How long?' he asked. 'Until you reach years of discretion.' I cried, and turned away. Jim is twenty-four. Twenty-four. And I married at twenty-one. Yes, and ran away, too. But it was different with me. My father had nothing to give me. I was quite independent." He was glad to have me shift for myself. Jim's father is a rich man. Jim's father has given him dollars where my father begrudged me pennies. Jim owes me filial obedience. He has disobeyed me to his bitter cost."

He unfolded the paper that he had taken from the envelope and ran his keen eye down the closely written lines.

"He has given up his father for a pretty face," he muttered. "Let him stand by the consequences. Who is she? What is she? It matters not. No doubt they trapped him into this marriage. 'A rich man's son,' they chuckled. But they'll find they're fooled. 'Father,' he said, 'I am to be married tomorrow night. Will you come with me to the wedding?' I turned on my heel. Then I looked back. 'You know the price you pay?' I cried. 'Yes, father,' he said, with his head high up. I know. Good-bye, and God bless you." He asked a blessing on me! Ha, ha, ha, that's too rich! But he'll get evil for good this time. I'll cut him off with a dollar. Let him sup on herbs for awhile. That'll take the veneer

from love's young dream. I'll draw up a new will at home tonight and have it witnessed before I sleep. And to let him know what his foolish fancy has cost him I'll write him a letter—a letter he can show to his new relatives. That's the thing—a letter."

He bent down with his head upon his hand and his eyes fixed upon the paper. A rustle of skirts in the doorway drew his attention. He did not look up. It was a way he had.

"Ah, Miss Morris," he said, "back again?" He had quite forgotten that he had sent her home.

The young girl in the doorway did not answer. Her bright eyes were fixed upon the old man. She expected him to look up. If he had done, he would have seen a charming vision. She was a very pretty girl—dainty and neat from the tip of her new hat to the tip of her new shoes. But he did not look up.

"Just in time," he added, "I want to dictate a letter before you go."

He paused, and the young girl, as if seized with a sudden fancy, quietly stepped into the room and seated herself at the typewriter.

"You have been with us so long, Miss Morris," the old man continued, "that we view you as a confidential agent. Besides, this will be public property very soon. I am going to write to my son. Last night he married an unknown girl against my wishes. I am going to tell him that I wash my hands of him and his; that to-night I change my will, cutting him off with a solitary dollar. Are you ready?"

The girl at the typewriter gave the instrument a preliminary click or two.

"James Mitchell," began the old man, "as you have seen fit to disobey me, to cast my fatherly wishes in my teeth, I desire you to know that I have no wish to hold further communication with you. While I cherish the impression that you were lured into this unhappy marriage"—

The typewriter stopped.

"Unhappy marriage," the old man replied, and the clicking recommenced; yet I cannot accept this excuse for your undutiful conduct. To-night I change my will and you may rest assured that your name will be passed over with the smallest possible financial consideration. I prefer you to understand this here and now. It will prevent you and your new friends from cherishing any false hopes. This is all I have to say, and no reply will be expected.

ABEL MITCHELL.

The young girl drew the sheet from the machine, and, bringing it forward, laid it on the old man's desk. Abel glanced it through.

"A beautiful copy," he said, and carefully folded it. Then he placed it in an envelope and dipped a pen in ink.

"I do not know his address," he said, and knit his brows.

The girl at the end of the desk extended her hand.

"If you have no objection," she quietly said, "I will deliver it to him."

"I am Alice Mitchell," said the young girl. "Mitchell!" repeated Abel, dully. "M—my son's wife! And what?"—but the ugly words would not come. He could not utter them in the light of those gentle eyes. Will you be seated?" he lamely added.

"Thank you, no," said the girl, in person.

The old man looked up at the fair face bending over him.

"Why, who are you?" he cried. "I have but a few words to say; they will not detain you long."

Abel's gaze dropped to the letter and the will, and a sarcastic smile twisted his mouth. "No, no," the girl quickly added. "I have not come to plead with you. You are quite wrong, too, to insult me as you did in that letter."

He looked up again quickly. There were tears in the gentle eyes. And there was a glint of fire in them, too.

"You insulted me and you insulted my dear father. I have no mother." She paused a moment. "When you insinuated that my father was mer-

Let us tell you
**How to Increase
Your Farm Profits**

HERE'S the answer: Build a telephone line—you and nine or ten of your neighbors—so that you can keep in daily touch with your markets.

The telephone is more of a necessity on the farm than it is in the city. You can buy a

Stromberg-Carlson Telephone

equipment at reasonable costs and by following our easy and simple directions can build the line yourselves.

A telephone on the farm keeps you in touch with the markets and enables you to get medical or other assistance quickly when needed, to say nothing of its social features.

Let us send you our book, "How the Telephone Helps the Farmer," 25th edition and other booklets. They are free.

Telephone and Electric Equipment Co.,
Seattle San Francisco Los Angeles

cenary in this matter you did him a cruel wrong. He was bitterly opposed to our marrying without your consent. I disobeyed my father, too. But it was not for your money. This The old man dropped his eyes beneath her reproachful gaze.

"Perhaps I was hasty, he slowly said, but the provocation was great." Then he quickly added: "But knowing as you did that I opposed the wedding, and your father opposed it, too, why did you permit yourself to marry my boy?"

"I could make it clear to you, I think," said the girl gently, "if you loved your boy."

The old man trembled. If he loved his boy! All that was near and dear to him—all that was left to him of kith and kin. The babe that a dying wife had solemnly placed in his paternal arms. If he loved his boy! He drew a long breath and stared hard at the blank envelope on the desk before him.

"And now," said the young girl, "I only want to add that I think Jim was quite wrong in crossing your wishes. He might have waited. I wanted him to wait. But he is so proud, so self-willed. I am very sorry that I should be the means of separating you, and I—I am quite sure I am not worth the great sacrifice my dear—my husband—has made."

Abel was quite sure there were tears in her eyes again, but he did not look up.

"Where is Jim now?" he asked. Then he smiled grimly. "And why are you not enjoying your—your wedding tour?"

"There was a vacancy in the bank where my father is employed," said the girl, "and father secured it for Jim. His duties began today. Perhaps we will take our wedding journey later. We have to look out carefully for the main chance, now you know."

"And you didn't expect to fall back on my dollars?" said the old man.

"Not a penny of them," quickly replied the girl.

The old man fidgeted in his chair. "And why not?" he asked.

"I think you understand," said the girl, and her gaze dropped to the letter on the desk.

"Does Jim know you are here?"

"No. At least he didn't know I was coming. Father will tell him to meet me at the corner at 5 o'clock. I must go."

"Wait," said the old man quickly. He looked at her searchingly. She met his gaze with a smile. Her mind was on Jim.

Abel deliberately put the will back in its envelope, and the envelope in its pigeon hole. Then he picked up the letter in its unaddressed envelope, tore it into minute particles and tossed them into the waste basket.

"I have changed my mind," he softly muttered.

He pulled down his desk cover with a bang and reached for his hat. "There," he said, "I'm ready."

Then he added: "Will you give me your arm, my dear?" As he passed through the doorway he paused.

"I think, Alice," he said, "that you and I are going to be very good friends. And now we must hunt up Jim and take him home with us."—Cleveland Plain Dealer.

DESSERTS.

Heavenly Hash.

One pineapple, sliced thin; four oranges; sugar; one box strawberries; six bananas; lemon juice.

Put a layer of pineapple in a dish; cover with sugar, then a layer of berries, of orange and of bananas until all are used. Cover each layer of fruit with powdered sugar.—Mrs. L. W. W.

Orange Sponge.

One ounce of gelatine; one pint water; six oranges; one lemon; three eggs, whites only; sugar to taste.

Dissolve gelatine in pan; let stand until almost cold. Mix in the juices of the orange and lemon; add eggs and sugar. Whisk all together until it is white and spongy. Put in molds. Will be ready for use the next day.—Mrs. G. W. G., Riverside.

Peach Rolls.

Stew dried fruit; sweeten and

POULTRY

NOTICE—I HAVE SOLD ALL MY COLUM-bian Wyandottes and good will to **Mrs. A. R. Scott of Compton, Cal.**, **M. E. DILLINGHAM**.

"How provoking!" an ancient Emperor is said to have remarked as he fell, stabbed to death, on the floor of his palace. That's an extreme illustration of the light way in which some people take things, but there is many a man who uses for shaving a soap that smells like an own brother to an automobile and bites like tabasco after the shaving has been perpetrated. Yet he goes on year in and year out using kitchen soap on his chin and saying things each time that he'll be sorry for some day. How much simpler and easier it is to get the right preparation and avoid all this trouble, danger and pain. **Williams' Shaving Soap** is the original Shaving Soap.

"By sending a 2c stamp to the manufacturers, **The J. B. Williams' Co.**, Glastonbury, Conn., to pay postage, you can obtain a free sample."

Lambert Engines

The Cost

Of pumping water for **Irrigation** can be greatly reduced by selecting the **Right** power and pump.

We have acquired valuable information in installing thousands of

Potatoes.

Potatoes are weak in tone and lower in quotation. In car lots plenty of offerings are made for 1.30 for extra fancy stock, with few takers. Further decline is anticipated.

Highlands...1.20@1.50
Early Rose...1.75@2.00
Salinas...1.75
Sweet potatoes per lb...1¼@2

Onions.

Dealers are only just beginning to realize the crop shortage of California onions this year. Already Oregon onions are coming into this market freely, as a result of the shortage, and the price on Oregon is about \$2.25 delivered, consequently they cannot be delivered to the trade at the present time for less than \$2.50, and it is the belief of the largest shippers this price will double before the holidays are over.

Has been on the market since 1842—two-thirds of a century, and is made in the largest and oldest permanently established plow factory in the world. It is

The Perfect Plow

WHY?

Has a high beam, giving good clearance at the throat. The beam and handles are long, giving a powerful leverage. The handles and beam are thoroughly and strongly braced, and the plow will withstand any strain. The bottoms are mechanically perfect in shape, material and finish, and have the high polish and scouring qualities which have made the **P. & O. Canton Clipper** the leader of all plows in all sections.

Quality and merit wins, and the Canton Clipper has both. Hundreds of thousands are in daily use—a lasting testimonial to their superior features.

You will make no mistake in buying a **Canton Clipper**, as they never disappoint.

Fresh Fruits.

Fresh fruits continued out of favor on account of the wet weather and the effect of the rains of the previous week were noticeable in yesterday's arrivals. Apples dragged along in buyer's favor, with cheap stock the ruling variety. Grapes came in the worse for the rains, with a moderate inquiry from the trade. Figs were likewise poor in quality and sold at shaded figures. New crop arrivals of oranges are slow in coming in, but considerable is due to arrive shortly.

Citrus Market

LOS ANGELES, Oct. 30, 1907.

The first of new crop navel to be received in this market arrived yesterday from Arizona. They were very large running 96s or larger and sold at 5.50@6.00 per box.

This fruit is received from Yuma, just as the last year's Valencias are being shipped to the East, and are bringing as much here in Los Angeles as are the Valencia oranges in the East, and this consignment demonstrates that shipments of oranges will probably be kept up throughout the year in the future.

The season, or the orange year, ends tomorrow, and Nov. 1 the new year begins.

The demand for grapefruit is keen and at good prices.

Lemons have also felt the upward movement and all available packing stock is being sent East, where there has been a continual improvement in the market for some time past. Select lemons here are bringing from 2.75 to 3.50 a box, with a very few offerings. Culls are worth considerable more than they were a month ago.

Shipments.

Shipments to date total 27,467, of which 3485 are lemons. Last year same date, the total was 25,944, of which 3904 were lemons.

DESSERTS.

Continued from Page 429

flavor to taste. Make a good baking powder crust; roll very thin and spread with fruit, putting small pieces of butter on the fruit. Roll up and place in a deep pan. To three or four rolls add one cup sugar and one-half cup butter and pour over this hot water enough to cover. Bake one-half hour. Serve with sauce or cream and sugar.—Mrs. M. G. M.

Fruit Dumplings.

One pint flour; fruit; a little salt; two teaspoons baking powder; milk to make a very soft dough.

Sift the salt, baking powder and flour together; mix with milk till very soft. Place in a steamer well greased cups. Put in each a spoonful of batter, then one of fruit. Cover with another batter. Steam twenty minutes. Serve with whipped cream or lemon sause.—Mrs. R. E. S.

Chocolate Pudding.

One pint milk; large half cup sugar; two heaping tablespoons grated chocolate; one heaping tablespoon corn starch; pinch of salt.

Let milk come to a boil, then add the sugar and chocolate well mixed, then the corn starch wet with two spoons of the milk. Boil until it thickens and turn into cups or mold. Set it away to cool. Serve with whipped cream well sweetened, or with plain cream and sugar flavored with vanilla.—Miss R. W.

YUCCA MANUFACTURING COMPANY
1380 Willow Street Los Angeles, Cal.

When writing advertisers, mention Cultivator

Does this stream of water look good to you?
It certainly does to the two men standing beside it. They are the President and Treasurer of the company to whom the plant belongs. It is raising 40 inches of water from 250 feet below where they are standing. This water goes into a reservoir 18 feet above the pump through an 8-inch pipe-line about one-eighth mile long and you cannot see a pulsation in the discharge if you try. It has been doing this for over a year. There have been no repairs, not even new leathers, and it runs better, if such were possible, today than it did a year ago. How many pump users can say this? It shows conclusively that it pays to install good machinery. We have done this for these people and we can do it for you if you give us a chance. Our catalog tells all about it. Mail us a card asking for it today.

POMONA MANUFACTURING COMPANY

POMONA, CAL

Grind Corn and Cob Profits

This "Jack-of-All-Trades" Engine and Grinder grinds corn and cob at one operation, so you don't have to shell the corn and grind the cobs afterward. Soon saves its price in feed alone. The engine runs churning, separator, pump, buzz saw—does almost all of the hard-work chores. It also earns money for you by working for neighbors. "Jack-of-A-Trades" is the ideal farm engine because portable—easiest to understand and run—most economical in use of fuel. Built of very best materials to stand hard knocks. Our name on every engine is your best guarantee. Comes to you complete, so you can set it to work at once.

Does This:
Runs Buzz Saw,
Pump, Grinder,
Churn, Separ-
ator, and does
other chores.

Dedication of Farm and State Institute

An Enthusiastic Greeting Given Those Who Have Been Instrumental in Securing the Farm for the State. A Trainload of Grangers from Sacramento

PROFESSOR E. J. WICKSON called to order a large and enthusiastic audience at the State Farmers' Institute and dedication of the State Farm at Davis, on Tuesday of last week. He came to learn and to celebrate the inauguration of the educational work of the State farm, which has been looked forward to for these many years by farmers—and all well wishers of the state.

President Wheeler in his address of welcome, said in part:

President Wheeler.

We are met to initiate what I expect will prove a new and significant departure for the education of California youth. It concerns industrial education and particularly that branch of it which affects the complex body of arts practiced in the life of an American farm; and industrial education is a form of human training which assures the reverse the direction of the prevailing book and blackboard education and move from the outside in, instead of from the inside out. In, for instance, the case of agriculture the old way started with principles and built up the imaginary farm; the new way starts with the real farm and provokes an appetite for principles. There may be two ways of producing loaves of bread: to start with lectures on the chemistry of yeast; the effect of heat on starch and the centigrade measurement of the temperature of ovens, or to start with the traditional skill of an actual art in bread making, and correct guide that of scientific knowledge and experiment;—there are the two ways, but we have no doubt which is better for the digestion.

The most significant change in the attitude of university education during the last two decades is found in the frank tendency to relate itself to the larger circle of human occupations in actual life. At our own university within the last decade have been added, for instance, courses training directly for life in architecture, hydraulic engineering, sanitary engineering, railway engineering, irrigation, forestry, banking, general business and the consular service. The old education did, indeed, in its origins, adjust itself to the training of teachers, theologians, doctors and lawyers, but it stopped there, and inclined to think this training or one of these trainings all that could worthily be offered to others who might come to the doors of the university without plans of life. So it came to pass that the college gradually sundered itself from life and followed, in default of clearer aims, a certain groping after a discipline or culture that might be hoped to serve the general purposes of free and manly living. And such a purpose it has, by the kindly help of Providence, more than by the wit of college masters, served in much larger measure than one would have thought or now could explain—except that continued contact with the best thought of human kind always awakens thought, and that rethinking the thought and reliving the experiences of men in fields that suppleness and sympathy of mind which is a first essential in meeting social problems and dealing with human beings.

Fifty years have elapsed since the beginning of the first experiment in agricultural education in Michigan, and under the quickening influence of that venture and others that succeeded it, the whole nation of teachers has been assuming a new conception of the whole meaning of their

task. It is coming to them not through a-priori reasoning, for of that they did enough before, but through observation and practice of ventures such as those made by the early agricultural schools. They now seem to be learning that education inheres not in what you put into a man, or what you hang on to a man, nor yet in sterilizing him or shaving him down to a standard shape, but in giving him, such as he is, and such as his left activities may be, the opportunity, in and through these activities, to live his life fully and effectively and abundantly. Such education proceeds upon the recognition that no hypertrophy of mind or body is as good as plain health, that plain health is the best medicine for all disease, and that the normal exercise of plain life is the straight way to plain health. Such education will, therefore, address itself perforce to the real doings and exercises of real life, and its definition will be: The guided practice of life, to the end that men may live.

The Prize Farm.

Prof. Wickson said he wondered how many knew that forty-nine years ago this farm was declared the prize farm of California. It had then about 8000 acres with a big orchard and 1200 acres of alfalfa. It was a Garden of Eden, and the fig trees, the only survivors of the orchard, are here to start the new Garden of Eden. He introduced George W. Pierce, of Davisville, as a product of the district.

Mr. Pierce's Address.

Mr. Pierce said that today a new impulse was to be given to agriculture—an attempt was to be made to uplift the farmer. It is the beginning, he said, of a new era and he welcomed the assembly as members of a building committee to that end. He welcomed them as members of an advisory board to the regents of the university. Today's conditions, he said, call for making two blades of grass grow where one grew before. It is the day of diversified farming and of small tracts. The instruction given here will tend to increase the number of small farms and bring the farmers into closer touch with their fellows and break up their isolation. To the board of regents he offered this new institution. With its inheritances it should become a giant in its class. It is the entering wedge to the progress and welfare of the California farmer.

From today, he said, will date an awakening in California agriculture, horticulture and stock raising, the far-reaching importance of which can be scarcely estimated. Today the work starts on broader lines. The State is to try to induce the farmer to develop his skill as well as his muscles, to exercise his intelligence as well as his powers of endurance. For its success this movement must look to widespread active influence of capable friends of agriculture throughout this State. With the advent of new commercial conditions, increased and complicated transportation facilities, the introduction of irrigation and the sharpening of competition has come the necessity for a change in California farming, and we must meet the new conditions if we want to succeed.

Lecturer of State Grange.

F. H. Babb, lecturer of the State grange, spoke of his gratification at the opportunity to respond on this occasion. It was a great one. He was glad to welcome Professor Wickson, who had

done so much to lighten the troubles of the farmer. Not only does the grange need the college of agriculture, but the college of agriculture needs the grange. There was a time when the college at Berkeley was not extensively patronized in its agricultural department. The grange has always stood loyally by that department and at its last session the State grange decided to send one of its younger members to be educated here. We, he said, will do well to co-operate in future with this department of the university. The only trouble with the grange is that there are not enough granges. In the East nearly every farmer belongs to the grange and attends its meetings.

Senator Diggs Speaks.

Professor Wickson said this movement had been one of Bills. He mentioned five citizens by that name, and said the sixth was the Diggs bill, and he would call on Senator Diggs. Mr. Diggs said he had been an earnest worker for the farm. Years ago he had worked for it, and of late had been a member of the Sacramento valley association, which always takes a hand in anything that will be a benefit to the valley. He knew of nothing they had worked for that would be of more value to the valley and the State. He congratulated the committee on its selection of the site, the people of the valley for the opportunity opened to them, and the fathers and mothers for the opportunity to educate their children in agriculture and induce them not only to become farmers, but to remain farmers—to achieve success on the farm and to make happy homes there. There is too much tendency, he said, for farmers' boys to go away and enter other callings.

There is the careful, capable farmer, who attends to details and is successful; there is the pedro farmer, who lives in the city and takes his ease. He was proud to be called on to respond on this occasion and to testify to his gratification at its object and consummation.

Senator Boynton, of Oroville, also responded to the address of welcome.

For All Time.

Judge P. J. Shield, of Sacramento, who worked hard for this farm, in a short talk said:

The work we do tonight is the first exercise of the educational purpose of this institution. The activities we now inaugurate will last for all time, and their influence will profoundly affect the industrial life and the social character of this whole western country. In the presence of such a condition I feel almost stunned; confused by the multitude of suggestion which this occasion prompts. But one thought occurs to me with distinctive force—it is this institution is the result of a want long felt, of hope long deferred, and of the protracted and severe labors of a number of broad-minded and far-seeing men and women, whose patriotic solicitude discerned the need of their State, and whose accurate observation of modern progressive tendencies indicated to them how that need might be best supplied. As a consequence we have this farm and this school so nearly accomplished that tonight we permit no doubts of the complete realization of our hopes and plans to cloud or qualify our happiness.

The old idea of education related only to a man's mind as a thing apart from his body and his life, and concerned itself only with the ideal.

Confidence

is essential to business prosperity.

Confidence is simply another name for credit, and when credit is lacking business is paralyzed.

Ripples on the surface of prosperity do not alarm us. We have confidence in Los Angeles and we have confidence in her banks, born of intimate association with them for many years.

Because of this confidence we are still selling conservative mortgages and high grade bonds and are taking our pay in checks on the Los Angeles banks.

If you have money to invest, do not delay calling on us because your money is tied up temporarily in the Savings Banks.

We can use your checks and wait for our money until the banks resume payment. We invest our own money in the securities offered. They are safe. We invite investigation.

Oranges and Lemons

When the right varieties are properly grown and planted, are money makers. Our new booklet on Citrus Culture tells all about the standard sorts, planting, cultivation, irrigation and packing the crop. Over 100 illustrations and something like 50,000 words of text. The price is merely nominal, namely, 25 cents. May we have your name for a copy?

WITH A SEIVERT OIL BURNER

You can burn 100,000 feet of air with every 120 gallons of oil; this means perfect combustion. To burn more than 100,000 cubic feet of air with 120 gallons of oil, there is a decided loss of heat. To burn less than 100,000 cubic feet of air there is a loss of fuel. The only safe and reliable burner on the market. Send for full particulars.

LEMON MEN'S CLUB.

AT A recent meeting of the Lemon Mens' Club held in Los Angeles, the subject of mealy bug was discussed. This pest is very active in certain sections around San Diego and also is appearing at Covina and certain surrounding districts. This is a most difficult insect to handle, resisting fumigation and spraying does not eliminate it. Mr. B. J. Jones, of San Dimas, says that whenever the mealy bug appears there, it is soon followed by the brown Lace-winged fly, which seems to hold it in check.

The effect of the mealy bug on the lemon is a heavier coating of smut than is produced by the black scale. The insect secretes itself in the smallest crevices and folds of bark and is almost impossible to eradicate from these places. The climate of San Diego seems to suit this insect, which is one of the hothouse pests that is so hard to manage. There is a parasite working on the bug at San Diego, but it does not hold it in check. It is hoped that this, with the brown Lace-winged fly, will suppress it so that it will not be any worse than the black scale, at least.

The subject of distance in planting lemon trees was brought up. It was stated that on the Limoniera Ranch at Santa Paula, part of the orchard was planted double in each row; that is, the rows were the same distance apart, but the trees were planted half as far apart in the rows as the distance from row to row. In another part, pomelo trees were alternated in the lemon rows, these afterwards removed, leaving all lemons. It was expected that the lemons in this part would at once proceed to produce much larger crops than the same number in the part planted double to lemons. The result was that they continued to produce half as many lemons as the double planting. As a result, the double planting has remained double, it being the original intention of the owner to thin them out after a few crops had been harvested.—J. W. Mills.

"PEDDLING" WHITE FLY.

SINCE the White Fly scare began sometime ago many prophets have arisen, offered various and sundry methods of determination and control, warned the public broadcast of the terrible consequences surely incident upon its introduction and offered in the most open handed manner possible, to determine any and all doubtful pests which might be brought to them; in fact, if anything doubtful should be found the proper thing, according to their writings, is to take it at once to an expert so that the worst may be known at the earliest possible moment and further infection thus avoided.

Few, if any of these, and I have followed them all very closely, have even suggested that the grower could not possibly make a greater mistake than to remove the pest from his grove or even from one part of the grove to another, I have known of insects being carried over many miles of citrus country for determination. Now if some of these should really be the White Fly this would be the best possible means of spreading it abroad throughout a distracted community. The whole scheme of horticultural quarantine is based on this principle, and while there is such a

careful surveillance of importation our own people should be warned against the possibilities of local distribution by the moving of doubtful pests of any kind.

It is evident by the volumes that have been written on the White Fly from every quarter of the citrus region that there is an abundance of local talent, not to mention the county inspectors who are always present so that some expert could be found available to every grove who could determine the pest in situ, and the persons should always be taken to the pest, rather than the pest to them and if they cannot determine it they will at least be provided with killing jars or other means of killing the insect before removing it from the tree on which it is found. Each inspector and each horticultural writer should make himself a committee, one to warn the growers against moving these doubtful insects, for there is a great tendency among orchardists since this problem has arisen to take these things at once to their inspectors or commissioners for determination, and too often there absolutely no provision made against their escape and spread into other groves.—B. J. Jones.

CALIFORNIA-GROWN TREES IN PALESTINE.

The Cultivator has spoken in the past of orange trees sent to Mediterranean points by the Teague San Dimas Nurseries, and we are now glad to get report for them from the other end of the line, we quote from a dispatch in a paper:

Many Californians who have returned from their European trip have expressed surprise that they have been able to buy at the Mediterranean ports navel oranges grown at Jaffa, Palestine.

A writer in the Sunset Magazine also called attention to the navel oranges of Jaffa as being sweeter than our Washington navels grown in Southern California. It may be a greater surprise to the Sunset writer and also to our Californians who enjoyed eating these oranges from Jaffa, to know that they are grown on trees shipped from the nurseries of R. M. Teague of San Dimas, the largest citrus nurseries in the world. Six years ago Teague shipped his first consignment of 3000 navel trees to Jaffa these reached there in excellent condition, with a very small percentage of loss, and in four years the oranges from these trees were being sold to the passengers on the steamers on the Mediterranean. Since then Teague has done a large trade with Palestine orchardists.

JAPANESE WILL PICK ORANGES.

The Porterville Messenger says Orange picking is about to begin in this district and with it arises the fear among the pickers that the grower will bring in Japs to do the picking. It is understood that a number of the local growers have expressed themselves as intending to hire a crowd of Jap orange pickers and to that end Jap contractor from Fresno will be here Wednesday of this week to sign up contracts for picking at 4 cents per box.

A large crowd of white pickers and contractors have arrived from the south during the past few days and they are contracting for picking at

ts. They claim that they ought to be 6 cents for picking but will work for 5 rather than see the Japs come in. The contractor, who has about thirty forty men working under him stated this morning that they wouldn't stand Jap laborers being brought in here. What means would be taken to prevent this from occurring the white contractor did not state but he said the Jap contractor would be met at the depot Wednesday.

It is said that there are plenty of white pickers to gather the entire crop in this district this year and do it quickly and that there is no need of bringing in any Jap labor.

ARE IN PICKING ORANGES.

A correspondent from Riverside in a daily paper, in speaking of the advantage to be had in greater care in handling oranges, says:

E. Rumsey, owner of the big Na Vista Rancho on Arlington Heights, has built a packing house which will be ready for occupancy soon. Mr. Rumsey intimates that he will produce the finest pack that has ever gone from the State, provided he can find men who will follow out his ideas. While he does not expect to lose money on his pack this season, he does not expect to make anything, his object being to try out some new ideas with a view of adopting them if found feasible. Considerable experimenting will be done in every way of using extreme care at every stage of picking, packing and shipping, regardless of time and expense.

FLORIDA ORANGES.

An estimate in an Eastern paper regarding Florida oranges this season, the following appears:

The oranges in Florida are of good size and promise to be large for the coming season. The crop will be better than it was last year. Last season, including oranges, grapefruit and tangerines, about 4,000,000 boxes came out of Florida. It is estimated that not more than 3,000,000 will go forward this year. The extended drought which prevailed all last fall hurt the orange trees very much and the frosts the winter previous did some of the trees a great deal of damage. Even 3,000,000 boxes is quite a bit to handle and market properly. Each year the grapefruit becomes more popular, and barring any bad accidents between now and harvest time, Florida's grapefruit will be more extensively distributed than ever.

IMMATURE ORANGES.

Elsewhere are given reasons why shippers of Florida should not send immature oranges to the market. Every effort should be put forth to discourage this practice. Just why consumers will pay fancy prices for the first Florida oranges is remarkable. They are not fit to eat, frequently being sour enough to pucker the mouth. Such fruit cannot be conducive to health, and it is a question if the boards of health generally should not take a hand and say it is wholesome. This is an age of pure, wholesome food agitation, and State and Federal governments are regulating foods strenuously. In many instances they do for the people what the people will not do for themselves. If immature oranges are unwholesome they could be barred by the health boards.

One orange receiver said he "would like to discourage the shipment of immature oranges, but the fancy

prices they always bring cover a multitude of sins." That is just the point. So long as the public will pay the price there will be shippers who will cater to them. In the end these immature oranges are a great detriment to the State of Florida. They are so sour that people become disgusted with Florida oranges and turn to those from California. This necessarily lowers the price for the Florida fruit and it slumps. Once down it is difficult to recover. If ripe oranges only were shipped the opening prices would likely be maintained.

Florida has not a full crop this season, so it is hoped the shippers will keep the immature oranges at home and thus get higher prices for all of their fruit.—Chicago Packer.

HUMUS OF THE SOIL.

Humus being the remains of dead and decaying plants and animals, is composed of the elements and compounds that go to make up plant and animal substances. These consist of carbonaceous and nitrogenous compounds and mineral ash. The first two are organic compounds, and the third is inorganic. The carbon compounds in decay resolve into water and carbonic acid. The nitrogen compounds in decay resolve into water, ammonia and some other gases, ammonia being the most important from an agricultural point of view.

All of the compounds of humus when broken up through decay are easily soluble, hence are readily available plant food. The mineral ash is practically wood ash, and is rich in potash and lime phosphate. The nitrogen compounds are, of course, rich in nitrogen, the basic element of living protoplasm, proteins and albuminoids, all of the essentials for the formation of blood and flesh of animals. The carbon compounds are of less importance, because plants can secure water from any soil and carbonic acid gas from the atmosphere.

Since all of the compounds of humus are easily acted upon by external agencies, humus is a very unstable and changeable substance. In contact with free air, it is quickly acted upon by bacteria, causing its decay, or breaking up into the various groups of compounds which escape into the air or soar away into the soil, unless there are growing plants to absorb them. The less water there is in the soil, the more rapid is this decay, since the water tends to shut out air which carries the decomposition germs. In arid regions where little soil water is present humus decay is so rapid that scarcely any can be detected at any time. In very wet regions the decay is very slow, and in swamps where water almost completely excludes air and the stagnant vegetable acids will not permit the formation of bacteria, and decay is so slow that the layer of humus becomes a solid bed, forming peat. When swamps are drained, allowing the escape of surplus water, or anic acids, and the ingress of soil air, then these lands become rich for cultivation.

Not only is humus rich in chemical compounds which cultivated plants thrive on, but it has good physical properties which ameliorate the soil containing it.

Humus in the soil augments the water-holding capacity. Such soils have their mineral particles so held apart that a large capillary surface is exposed for the reception and retention of water. The water, too, has a chance to widely diffuse, hence the soil is never apparently very wet. For the same reasons, the soil retains its moisture a long time, and soils rich in humus are nearly always moist.

Owing to chemical changes which produce heat, soils containing humus are warm. Besides the heat produced by the chemical action of decay, the dark color of the soil absorbs heat, making it the warmest of all soils. The same principles are employed in the artificial hotbed.

Probably the highest property of humus is its power of making soils friable and easy to cultivate. Whether mixed with sand or clay, it makes the soil fine, loose and a congenial home for the roots of plants.—Farmer's Voice.

I.H.C. IRRIGATING ENGINES

If the Water is Lower Than Your Land an I.H.C. Gasoline Engine Will Solve the Problem.

THAT is often the problem with irrigators—the water is lower than the head of the ditch. The old way of doing was to construct the ditch up stream (often several miles) and head it high enough so that the water would flow down upon the land. If the only available water was a lake or pond below the land, irrigation was usually abandoned, because it was thought that the water could not be pumped up in sufficient quantities, or the pumping operation would be too expensive. Irrigators know better these days. They are now placing I. H. C. gasoline engines on the banks of these low lying lakes and converting the waters to a beneficial use on their thirsty lands. They no longer find it necessary to build miles of extra ditch to get fall enough to reach the lands. An I. H. C. engine will take the water from the stream where it flows through or near the farm, and raise it any reasonable height. Irrigation problems are solved with the I. H. C. engines, because they have three main characteristics that adapt them to the work:

WESTERN GENERAL AGENCIES: Denver, Colo., Portland, Ore., Salt Lake City, Utah, Helena, Mont., Spokane, Wash., San Francisco, Cal.

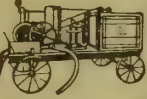

INTERNATIONAL HARVESTER COMPANY OF AMERICA
(Incorporated)
Chicago, U. S. A.

First—They pump water in unlimited quantities.
Second—They raise water at a low cost.
Third—They make a near approach to self operation. When set going they run for long intervals, regularly and dependably, with the least possible attention. The result is that I. H. C. gasoline engines are completely changing irrigating methods. Fertile but dry uplands are being brought under cultivation where a few years ago that was thought to be impossible.

Have you a dry farm on your hands? Or do you know of a fine piece of land you would homestead if you could get some "unappropriated" water for it? There is no reason why you should abandon your project. There's always near at hand a low lying lake or a slough or an underflow or a well or a stream down at the foot of the bluff. Find anyone of these, and an I. H. C. engine will put the water where you want it.

The engines are made in various styles, Vertical, Horizontal—Portable and Stationary. They range from 2 to 20-Horse Power.

Look into the matter and see which one of these irrigating powers will do for you. The local International agent will be glad to talk over your particular case, furnishing catalog and giving engine particulars. Or if you prefer, write nearest branch house for catalog.

Economical Spraying

Power Sprayers do the work **quicker**, do it **better** and do it **cheaper**—that is, if you buy the right kind. Some people think an engine hitched to a hand spray pump makes a Power Sprayer, but it is more likely to make a "Peck of Trouble."

Bean Power Sprayers

embody the practical experience of the best growers and contains scores of important details which are absolutely necessary for rapid, thorough work without annoying delays. You know that little things are what cause delays and expense, and it is all such points that five years of experience have eradicated from the **Bean Power Sprayer**.

Every **Bean** outfit is sent out complete, ready for work. Nothing left to fix up. No further supplies needed. It is complete and so simple that no previous experience is required for operating.

How the **pressure** is **kept constantly even**, the **liquid** **always stirred**, and why **spraying** can be **done for one-half the cost** of hand pump work, are all questions we shall be pleased to answer.

Call in and let us show you an outfit in operation.

BUTTER MAKING ON THE FARM.

CREAM should be stirred from time to time, every eight hours at least; this insures even ripening of the mass. When the time for churning comes, if the cream is not smooth and of a pleasant acidity without any rancid twang, it can be made to ripen more quickly by raising the temperature as described in last paper. The reason is that the keeping quality of butter is affected as well as the present flavor, when it is not properly ripened. Measure or weigh the cream as it is strained through a hair sieve into the churn. Remember for practical purposes "a pint's a pound the world around." If the cream is to a proper density for butter making three pints or a little less should make a pound of butter after it is worked and salted. If a heavy cream has been churned and falls below this amount then the cream was not evenly ripened. This can be tested by standing the buttermilk in the jar and stirring it occasionally for another day and then churning it. While this buttermilk will not make fancy butter it can be used for cooking. Once doing will make you able to check your work and it will probably not occur again.

Temperature.

A good thermometer is necessary if waste is to be avoided. I am often told by women that their fingers are good enough to test temperature. I tell them to get a thermometer and try it in the water; for instance, that in which they are peeling the onions, see how cold it is; then try the water after they have been washing dishes and their hands are heated and see how great a difference the temperature in which they have been at work makes to their fingers. One's "finger-test" is unreliable. Should I test cream with my fingers after running the typewriter they would be affected more easily than after washing them they would stand at least twenty degrees more heat.

Churning.

The churning temperature is fifty to fifty-five degrees in summer and fifty-five to sixty in winter. The temperature is easily made right by stirring with either the hot-water-filled bottle to raise the temperature, or with a bottle filled with cold water or shaved ice and salt to lower the heat. If pan or gathered cream is used do not forget to strain it into the churn to remove any particle of sour curds that may have mingled in the cream. These turn to curds and make a cheesy butter.

Churn.

A box or barrel-shaped churn gives a sharp concussion and makes butter most readily. The market is full of churns of various patents, but none as yet have proven superior to the old-fashioned box or barrel or triangular-shaped churn. The churn should be large enough not to be at any time over half full. One of the best butter makers I ever knew used to measure the cream into the churn and then add plain water if the quantity was lacking. This practice is not believed in any more, yet why I do not know, as my old aunt led the prize list with her butter in a

county fair where butter stands was high.

Scalding.

The wooden churn gives the best satisfaction. It should be scalded before and after using. The churn should be washed out with lime water and chilled with fresh cold water before the cream is put into it. Soap, or soap powders should be taboo around the churn. Avoid them also dish towels and the like around any vessels used for milk, cream or butter. Hot water, sal soda in solution, with lime water to sweeten will keep everything clean. The churn should be filled with boiling water; after ten minutes empty them out and turn side down to drain dry.

Churning.

Fill the churn half full of cream; take the temperature and make it right before starting to turn. The turning should be a slow even motion not to exceed four turns to the minute. In ten minutes, not to exceed thirty, the butter should come. If the butter comes sooner than this, the temperature make the churning temperature lower; if it takes longer, raise the temperature next time. But that comes in ten minutes indicates that the cream was over-ripened too warm. It is apt to be soft and not free from buttermilk, lacks keeping quality. Butter that is too light in coming is apt to be broken, grained and, therefore, is greasy.

Washing.

When the butter is the size of rice grains, stop the churn and drain off the buttermilk. Fill the churn with water at the temperature of fifty-five degrees. Turn the churn slowly six or eight times; the water stand for a minute then drain it off and let the churn stand with the cover on for ten minutes to have the moisture equally distributed before salting. Add one ounce to each pound of butter as estimated from measuring the cream. This is not high salting; in some markets the salt used runs as high as an ounce and a half to the pound. Spread the butter out in the churn and sprinkle the salt over it; then make one slow, deliberate turn with the crank to let the butter turn on the salt. Stop the churn, let the butter stand a while. Scald and work the butter worker. Use the paddle to lift the butter to the worker.

Working.

Now, butter working differs from bread kneading. The butter should be worked as lightly as possible. We are only trying to make the salt evenly through the mass and to compact it by pushing out the water held between the butter globules. In bread, on the contrary, we are trying to pack air into the minute spaces and to work the flour into a tenacious mass that will hold. Then when the yeast swells the bubbles with gas, the bread is light. When the butter is compact and the color is even then stop working.

Mottles.

These are simply caused by irregular salting; the action of salt is to lighten the color slightly and the salted globule of butterfat is, therefore, brighter in color than the

Veterinary Instruments, Black Leg and Anthrax Cure, Milk Fever Outfit, etc. O. J. Weber Co., 555-557 S. Los Angeles street, Los Angeles.

ing salted one. The salt when p into the butter in the churn and tained over into it, and then let ad while the worker is being pre- ped, has abundant time to be dis- sed by the water and to make it n throughout the mass. The salt held in solution between the glob- es of butterfat never enters into m.—M. E. Sherman.

GOOD POINTS ON TRAINING COLTS.

ome farmers have fractious es because they do not begin dling them soon enough. They hem go until they are two or ee years of age, then they halter m and, of course, their wild ures are hard to subdue. We all ognize the fact that if a child kes a successful and useful man training must begin in early life. This law holds good with the rther order of beings, why not h the lower? I firmly believe it es, and this truth I can substan- te by an actual experience in the nning of a colt.

One time I owned a driving mare. e had a mean disposition and etimes kicked and tried to run ay when excited. I'm sure it was cause she had been left untamed til she was two or three years old. bred her to a high-spirited horse d she foaled a good colt. The day ame I went into the lot, caught and petted it, rubbing it all over m nose to tail. I met with some sistance, but the colt soon began understand that I was its friend. Journal of Agriculture.

RELATIVE VALUE OF HORSES AND MULES.

It may surprise some readers to arn that the average per head ue of mules in this country is er 20 per cent above the value of rses, or \$112.16 for the first against \$3.51 for the last. The average ue per State ranges from \$62 in lah to \$153 in South Carolina and orgia. The Southern States have e highest priced mules, but in such ominent horse States as Illinois, io, Indiana and Iowa, mules aver- e from \$104 to \$116, and in every ate except one, Minnesota, the erage value of mules is higher n of horses, and in the last State e difference is only \$3-\$94 for ules and \$97 for horses. Even in e States of lowest mule value they anage to get horses of still lower ue.

The total number of horses on nuary 1, 1907, was 19,746,583, and d mules, 3,816,692, or nearly one in e.

TICKS ON SHEEP.

Prepare a quantity of sheep dip e same as for dipping. Then etch the sheep, lay it on its back d pour a stream of the dip along e body from chin to tail. An old a or coffee pot is the ideal thing to e in applying the dip. In a minute less the dip would be seen oozing rough the fleece at the back. Then let the sheep go. Its body is et where the tick abides next the in and the tick killed. Coal tar oduct dip, of which there are many a the market, may be used. If this ot within easy reach, go to the ug store, procure a pint of crude rboic acid, mix with it either a nt of soft soap or a quarter pound any hard soap dissolved in a pint boiling water and use one part of e acid and soap mixture to a hun- ed of warm, soft water.

FACTS OF INTEREST TO FARMERS.

New ideas in the care and feeding of farm animals have brought to pass some radical changes in farm methods, greatly to the advantage of the farmer.

As for instance, take what may be called the "tonic idea." It teaches the necessary use of a proper digestive and corrective preparation during the weeks or months in which an animal is being fitted for market.

While this is a comparatively new idea, its importance cannot be over-estimated. No one single feature of the "new farm science" touches the profit side of the business so directly as this.

It points the way to a vastly more prosperous era in cattle raising as a branch of farm operations. It means greatly increased profits and a business established on a permanent basis.

The "tonic idea" is a simple, common sense proposition that the feeder of live stock will instantly appreciate once it is brought to his attention. Every feeder knows that at some point in the fattening process there may come to the animal a more or less serious digestive breakdown caused by a long-continued heavy feeding. No need to say that this disaster is to be avoided if satisfactory results are to be reached or a margin of profit realized.

The purpose of the stock "food tonic," then, is to correct and prevent just this dangerous condition, and as the "ounce of prevention is worth the pound of cure" it follows that no feeder can afford to wait until the mischief is done, but should keep the digestive apparatus of his fattening cattle in a healthy condition from the start by the use of the tonic.

Experiments carried so far that there can be no reasonable doubt of the accurate results reached, prove that a "food tonic" containing the bitter principles which aid digestion, iron for the blood and nitrates which cleanse the system, is especially beneficial in preserving perfect animal health under all conditions.

No farmer or feeder can afford to risk his stock without it.

By acting directly upon the digestive organs, it enables a fattening steer to consume, day after day, large amounts of grain, and of course lay on the flesh rapidly.

To the cow in milk the result is the same, except that the increased assimilation of food is secreted as milk rather than fat.

To horses the "food tonic" is very valuable. General good condition is always present where it is given and in fitting for market it gives most successful results.

Sheep and hogs derive an equal benefit from the "food tonic."

Lambs grow more rapidly where a very little is given in daily doses and tip the scale at a better figure when market day comes.

Hogs receiving it are uniformly healthy and make enormous growth in less time than would be possible under any other system of feeding. These facts show how vitally the farmers' interest is associated with the "food tonic" idea.

Such men as Professors Winslow, Quitman and Finley Dun indorse its ingredients and successful men are using it.

Clean out the cow lot before the hot weather begins. The task can be easily accomplished with a scraper and team. Nothing is more offensive than a filthy lot in hot weather and milk is contaminated quicker there than any other place on the dairy farm.

Frequent and thorough churning will obviate the difficulty so often experienced in having the butter full of white specks.

HELP THE COWS
Even the best cows can't make big profits for the dairyman who persists in using pans or crocks or a poor skimming separator. Cream is cash, and if yours is just an "average" herd, then how much more necessary to skim out every drop! Why not help the cows boost your profits by skimming their milk with a reliable **UNITED STATES SEPARATOR**

SKIMS OUT ALL THE CREAM

HOLDS WORLD'S RECORD

A cream separator is an acknowledged necessity to profitable dairying, but before you buy why not look very carefully into the matter and buy the best one at the start? It's cheapest in the long run. We'll gladly send you, FREE, an illustrated book, telling what a separator can and ought to do. Please write us today "Send your book No. 20."

HANDLING A CASE OF GARGET.

Dairy cattle properly fed and managed, are liable to few diseases. If pure air, pure water, a bright, clean, sunny barn, a liberal supply of wholesome food, with a frequent but gradual change of diet, are provided, there will be little need for remedies or the services of a veterinarian.

Pulse Beats.

The pulse beats per minute in a healthy cow number from 45 to 60. The pulse is taken at the side of the jaw opposite the attendant or just above the fore fetlocks. The temperature of animals is usually taken in the rectum with a clinical thermometer, and a healthy cow will have a temperature of 100 to 101 degrees. The breathing, if hurried, can be seen by the movements of the body. To count the respirations the palm of one hand (clean and free from odors) can be held in front of one nostril. About 15 respirations per minute are natural for adult cattle. The breathing rates are fairly reliable guides in cattle and horses, but not in sheep. The reluctance to eat, absence from the feed trough, hanging behind the herd, are all valuable indications to the careful stockman and should be looked into and the cause found.

The chief ailments to which cows are subject are garget, milk fever, hoven, sore teats, warts, ringworms, pneumonia and abortion.

Garget.

Garget is an inflammation of the internal substance of the udder. One or more of the teats, or whole sections of the udder, become enlarged and thickened, hot, tender and painful. The milk coagulates in the bag and causes inflammation where it is deposited, which is accompanied by fever. It most commonly occurs in young cows after calving, and in big milkers, especially where they have been forced. An attack of garget requires instant treatment; neglect may cause serious results, while immediate care may soon overcome the trouble. The treatment varies somewhat according to the peculiar character of the attack; and this differs greatly as the causes differ.

Causes.

The causes of garget are constitutional tendency to inflammatory disease; overfeeding with stimulating food, such as cottonseed meal, which readily provokes it; inflammation resulting from cold, as exposure to cold rains soon after calving, or by lying on damp, cold ground; excessive muscular strain, as by chasing around when the udder is filled; retention of milk, either purposely done by the owner, or by the cow withholding the milk; and lastly, by a sort of reflex action on the milk glands produced by a general condition of the cow which disturbs the circulation and forces it excessively in this direction, or which produces a diseased and irritant condition of the blood.

Treatment.

It is readily seen that each of these conditions may call for a different treatment, and that it would not be difficult for the owner of a cow to do mischief by adopting the advice of a neighbor who might have at one time procured relief in a case having an entirely different origin. In some cases it is clear that medicine might be required. For instance, when the trouble is caused by some disease of

the blood, and this removed, the secondary effects may disappear. In some cases mechanical treatment only may be needed, as when the vessels and ducts have become engorged and the milk has clotted in them, and an alkaline injection would dissolve the solid caseous matter and enable it to be drawn away. In other cases, both this treatment and medicine would be needed, as when the blood is in an acid condition during a feverish state of the system, and alkaline salts may be given internally and injected into the udder as well.

Sometimes soothing outward applications may be necessary, as when muscular strains or accidental blows have caused the trouble; and at other times when suppuration is probable, some absorbent agent, such as iodine, may be applied and an antiseptic medicine given internally. In this case warm fomentations (eight ounces of vinegar and two ounces of camphorated spirit, well shaken and thoroughly mixed, applied just after milking and washed off in warm water just before milking) and it may be even advisable to apply hot poultices. When it is necessary to draw the milk from a disordered udder, a silver milking tube should be used, which, after dipping in a weak antiseptic solution of creolin is inserted in the teat, and through it the milk flows by its own gravity. The treatment overcomes any obstinate interference by the cow with the flow of milk, and it brings it down in spite of her objections.—Country Gentleman.

TRIED FLY PREPARATION.

A preparation for the dairy cattle to prevent fly annoyance is given in a Canadian exchange by a dairyman who claims that he has found it to be very effective, and gives the ingredients of the same as follows: To four quarts of coal oil add one quart of fish oil and one pint of some good stock dip; place in some vessel which can be tightly closed and shake well so as to form a kind of emulsion before applying to the cows. The above amount will spray 20 cows once a day for two weeks, according to the writer, and it will absolutely keep the flies off the cows.

Such a preparation costs from 35 to 40 cents a gallon, and whether this kind of preparation is used or not, it will pay every man who milks cows to have something of this sort on hand. The best way of applying the fluid is by using a sponge or a large cloth, which may be lightly passed over the parts of the cow on which the flies are most likely to settle. This can be done in much quicker time than might be supposed. By starting in at one end of the stalls and by standing next to the stanchions the adjacent sides of the cows may be quickly treated.

We have used the spray also, but found it was necessary to make an application of the preparations nearly every day during the worst part of the fly season. When practicing the former method, the result of one application remained effective for several days.

There is but little doubt that the increase in milk alone will pay for the preparation and time used many times over, to say nothing of the increased satisfaction in attending the animals.

The Oregon Dairy Association is preparing to hold an exhibition on December 19th and 20th.

Help the Horse

No article is more useful about the stable than Mica Axle Grease. Put a little on the spindles before you "hook up"—it will help the horse, and bring the load home quicker.

MICA AXLE GREASE

wears well—better than any other grease. Coats the axle with a hard, smooth surface of powdered mica which reduces friction. Ask the dealer for Mica Axle Grease.

STANDARD OIL COMPANY

Deciduous Fruit Culture

RAPE CULTURE IN SOUTHERN CALIFORNIA.

SHOULD some of the old rulers of Spain wake up and tour Southern California, they would wonder what had become of the laws that they enforced in the 16th Century which prohibited the planting of vines, figs, olives, etc., on the Pacific Coast. This country showed much promise as a grape country that Spain passed laws that prohibited the inhabitants from replacing any vines that died, and also fined captains of vessels \$2000 and forfeiture of charter for ten years, should they be found guilty of transporting any vine from one coast point to another, except that it had the stamp of Spain on it. The priests stationed at the missions in Central America and Mexico were the only ones who dared to disobey these laws. Had it not been for them it may have been many years later than the advent of the missionaries into California that we would have known that this part of the country was the home of the olive, orange and grape.

The first vineyards planted in California were at San Diego about 135 years ago. Vines were planted at San Gabriel a few years later and it was at this point that vines did better than any other place in California up to some time after that. Cuttings were distributed from this point to various other points north. It is thus that nearly a century and a half ago that it was demonstrated that California was the ideal home of the grape.

Riding on the train from Los Angeles to Colton we pass through an area of 10,000 acres planted to grapes. With a few exceptions, these are grown without irrigation and are profitable. This great vineyard is planted to a limited number of varieties of wine grapes. Table grapes of high quality are grown in various localities. Every year sees these areas extend, as the farmers find by experience that they have land adapted to the production of high grade grapes of certain varieties. For instance, one man found that out of a collection comprising the family vineyard, that one of the best paying grapes that he had was the latest. He has his vines on a southern exposure exactly where some of the earliest oranges are produced. Theoretically, this should not be so, and here is where the danger lies in giving advice, when no practical demonstrations have been made.

The desert regions, in conjunction with the coast regions, have given to Southern California what is, perhaps, the longest grape season of any part of the globe. From the former place, grapes are ripe from May till July while near the coast they ripen or are still on the vines from August to December, giving eight months in the year when fresh grapes are to be had.

The culture of the grape in the desert country is along the lines of culture practiced in the early times among California grape growers, excepting as to irrigation. When modern methods modified to meet their conditions are put to use, growers who are now astonished at the crops produced will be equally as-

tonished at the improvement in quality. Certain developments of the fruit indicate that other methods of handling the vines will give better results. These have to be tested first and will be in the near future. —J. W. Mills.

APPLE SCAB AND WORMS.

It will be remembered that the apple scab threatened to ruin the Newtown crop early this spring. The orchardists were advised to spray with the Bordeaux mixture as soon as possible, and many did so, with the result that scab advanced no further. So well did the Bordeaux spraying work that the scab loss in orchards receiving the treatment is very small. It is true that in the case of the White Winter Pearmain the early scab cut off their blossoms, and so rendered later spraying of little value. This variety should receive a thorough winter spraying with the lime-sulphur solution, and a Bordeaux application just before the opening of the flowers.

In general, the first Bordeaux mixture is most economically applied with the first arsenate of lead spraying for the codlin moth and caterpillars.

There has been some discussion regarding the use of the lime-sulphur solution to control the scab. There is some evidence to show that this spray applied just before the blossoms open will do the work, and it might prove a profitable venture for any who are reasonably sure of getting on the ground at that time to delay the winter spraying until near the flowering period.

Winter Spraying.

In general, winter spraying should be done as soon as possible in the fall. It is not necessary to wait until the leaves have all fallen. The winter spray should be even more effective at this time than in January or February, and the chances of favorable weather are much greater.

The results of last season's winter spraying is somewhat in doubt, as so much rain followed most of the applications that the scale killing powder of the lime solution must have been much impaired. It was noted that the commercial lime-sulphur solution did not kill moss as well as the lime-sulphur and salt formula had in former years. However, we continue to receive very favorable reports from most localities where these prepared solutions have been used. Further, the two compounds are theoretically the same, with the exception of the salt, and the ease of handling the commercial solution is a strong point in its favor.

Returning to the subject of summer spraying, arsenate of lead has shown its ability to control the codlin moth as usual, and there has been very little trouble from foliage, owing to the improvement in the brands handled here in that respect.

Arsenate of lead spraying is becoming yearly more satisfactory, and may now be regarded as an established practice. The orchardists should not, however, become too confident. It is necessary to spray for the scab and caterpillars about the first of May; two other thorough sprayings by the middle of June and one in August.

The San Jose scale, scab and codlin moth are well in hand, but the orchards in the valley are threatened by another disease apparently more difficult to handle. This disease is the apple powdery mildew. Experiments have been started with a view of determining a method of control. How successful the work will be time alone can tell.—W. H. Volck, before Pajaro valley Orchardists' Association.

Less Work—Better Results

The first matter of importance when spraying is to secure clean fruit and healthy trees; the next thing is to have expended the least possible amount of time and money.

Bean Magic Spray Pumps

are peculiarly adapted to do these things. They are entirely different from other pumps in almost every respect, but particularly because they

Save One-third The Labor

In the Spring rests the secret. What's the use in working so hard when the same results can be accomplished with a third less labor? Save time and effort by dividing the work, doing half at each stroke of the handle instead of doing all at one stroke, and meanwhile be working against only **one-half** the pressure indicated on the gauge. **Magic** pumps are built in two sizes and have non-clogging ball valves. It is worth your while to see one in operation.

We have samples of these pumps in stock and will be pleased to show them to you.

The Vegetable Gardener

HARVESTING ONIONS.

AFTER onions have been topped, pulled with a wood-tooth rake and cured in the sun, they should be carefully run over a grader and thus relieved of the small stock as well as of much litter and soil that has adhered to them and become detached while handling, says the Northwestern Agriculturist. A grader will pay its cost in increasing the selling value of a single carload of onions or potatoes, provided it contains any considerable quantity of small stock and dirt.

Onions, like apples, must be handled as carefully as eggs to insure good keeping qualities. Don't shovel them like potatoes or travel over them, because such careless methods will surely cause decay and sprouting in a very short time with the perishable bulbs. Discard all scallions or "big necks." They are worthless to the shipper and may ruin the sale of their associates in the car because they will sprout and soon decay in spite of good care and storage.

Crates are the ideal things for handling and storing onions. The buyer will often pay a premium for crated stock which will equal the cost of the containers. The crates, well made will endure several years of service. Onions will heat quickly when piled in large quantities. They are frequently stored in sacks. Provision must be made for a circulation of dry air between each row and tier of sacks.

WIRE WORMS.

Replying to a Kansas reader, we will state that the wire worm is very destructive to potatoes. It eats out the heart of the potato, rendering them almost worthless. This pest comes from the click beetle, which will jump up into the air with a sharp clicking sound when placed on its back. This beetle deposits its eggs on the roots of grass, if in the meadow; but if in the field, on the roots of pigeon grass or any other grassy weeds. The egg hatches the worm and it appears when it is assaulting the potatoes. In the fall this worm pupates. That is, it changes its form and encases itself in a hard, dark-colored shell. It generally stays in this shell till spring, when it emerges as a beetle. The worm, however, lives for two or three years before it pupates, which accounts for the presence of wire worms early in the spring. This also suggests that it will take two or three years to overcome the pest.

As a result of many experiments with the pest, it has been found that the critical period of the insect's life is from the time it pupates till it becomes a beetle. If molested even slightly the pupa will perish. It pupates usually about the latter part of July. If the ground is plowed then a great many will be destroyed, and if again plowed just before frost, many more, if not all, will be destroyed. This plan will have to be followed for two or three years before all of the insects are killed. Rotation from potatoes to small grain and plowing twice, as stated above, is another good method. It will be necessary to keep in small grain for two or three years before the plat will be entirely free from the pest.—Journal of Agriculture.

WHEN MELONS ARE RIPE.

Mr. Greiner, who edits the garden department of the Practical Farmer was asked how to tell when melons are ripe. The ripening season of melons is past, but the advice is good any time.

"You might shut your eyes, or blind, and could easily tell by your nose. The ripe muskmelon has a peculiar strong melon aroma. By the changing color of the rind, from the deep green of fresh, active growth, to a dull yellowish shade gives an unmistakable indication approaching or obtained maturity. The never-failing sign, however, is the ready parting of the melon from the stem. When you like the melon and it comes or breaks off easily from the vine, the melon is ripe for marketing. We often find our Emerald Gems and Gold Coins, already loosened from the vine, so that we simply pick them up, and may eat them immediately, as they are the fully ripe. If they have been lifted or even in the slightest degree twisted in order to make them let go from the stem, the melon should be stored in a cool place, and will then, in a day or two, be found in prime condition for eating. Closer observation and better judgment are required to pick out the ripe watermelon in a patch. An expert, however, is seldom fooled. To an inexperienced grower, however, liable to make many and annoying mistakes. As in the case of muskmelons, the changing color is about the best indication of ripeness. The upper part of the melon loses its freshness of growth and becomes a dull, I might say dead, green. Usually the tendril which grows from the vine directly opposite the stem of the melon dies and turns brown or black when the melon has reached its full maturity. The professional melongrower, however, tells more by the sound, when snapping the middle finger from the thumb against the melon, or by simply pressing lightly with the hand, than by any other means. The ripe melon when lightly pressed "cracks" or "snapped" gives that dull sound which the fine and experienced ear of the old melongrower easily catches and knows. In short, it is easy enough to tell a ripe melon of any kind when you know how to use your eyes, nose or ears."

VALUE OF POTATO TOPS.

Potato tops cost the farmer more than tubers in fertility. The same matter of tubers is mostly starch, while the tops contain a large portion of potash, for which reason potash is an essential ingredient in the cultivation of potatoes, as healthy tops and vigorous growth conduce to a large proportion of tubers. The tops of all root crops should be saved and added to the manure heaps.

Before applying the poultry manure to plants, pile it up with the soil, lime, sand and ashes, and let it lie to the weather for several weeks, then work it over several times at intervals of a week. The fertilizer thus prepared is quite strong, and should be applied judiciously. Poultry manure applied freely without composting will ruin most of the plants cultivated in the garden.

The Ornamental Garden

THAT BACK YARD.
IN SPEAKING of the back yard, I a writer in the Kansas Farmer says:
Of course you raked and cleaned the front yard nicely, but perhaps you forgot the back yard. If you did, see to it now before sickness overtakes the family.

Some people seem to think back yards are only good places to put woodpiles, old tin cans, old boots and shoes, ash heaps, etc. Put the wood pile off somewhere else or clean it up; haul off the old cans and shoes; pound up the broken crockery and glass for the chickens; and, if the ashes are wood ashes, apply them to the potato patch, garden, or orchard. If they are coal ashes, put them in the hen house, on the walks, or in the swamp holes on the farm to fill them up. In the summer we carry all our ashes direct to the potato patch or garden. In the winter we save them to make home-made soap and then put the leached ashes on the potato patch, and have never had any but good results. And here I want to tell you if you burn Osage orange, as many house-keepers in Kansas do, save the ashes to make soap. When we came here no one could tell us whether they would make soap or not. We have just finished making a half-barrel of excellent soft soap, almost thick enough to cut with a knife, and found the lye made from the Osage orange to be equal to that made from the best hickory.

To return to my subject. I have in mind two back yards that I saw as we drove to town one day. One had a bed of mixed chrysanthemums along the fence where it came handy to throw the wash water and how they did grow and bloom! On the east side of the summer kitchen was a vine of Virginia creeper that covered nearly the entire side of the building. On the north side was a bed, the full length of the building, of verbenas and pansies. Farther back toward the barn and henhouse on each side of the walk were grape vines, and in time a trellis will be erected over the walk to support them. There was no rubbish of any kind in sight and the weeds and grass were kept down as nicely as in the front yard where tea roses, pinks and honeysuckles bloom all summer.

The other yard runs riot with old cans, slop-buckets, broken crockery, rags, a large ash heap; and the wood pile is directly in front of and not a dozen feet from the door. Too many of our country homes are in this condition, not so bad, perhaps, but bad enough and they ought to be the most lovely and picturesque.

I heard a city physician say, "People would have better health if they would keep their premises clean; that every old rag, old shoe, and even broken crockery thrown around were sure disease breeders." So clean up, clean up! Burn all rubbish or bury it. Be sure the water supply is not contaminated with the drainage from the barn or stock pens, and that neither vegetable nor animal matter are left to rot and decay around the dwelling place. Use air-slaked lime and copperas water

freely to sprinkle around and in the hog pens, hen houses and water closets. Keep the swill barrel reasonably clean by scalding it out frequently and keep it covered to keep away the flies.

GROWING BULBS IN WATER.
One of the most artistic and inexpensive methods of cultivating blooming plants for home use is to grow bulbs in water. The Chinese are expert in this work and at their New Year festival the streets of Honolulu show a profusion of their sacred lily in full bloom, says the Hawaiian Forester. Very many varieties of flowering bulbs may be successfully grown in water, and it is surprising that this easy method of producing handsome blossoms should have been allowed to remain so long neglected.

In selecting bulbs for this purpose, large, heavy ones should be chosen. In many cities glasses are made especially for the purpose of growing the handsome flowers of the hyacinth, but any open bowl or vase can be used for these and other bulbs.

If grown in an open bowl, the bulbs selected for blooming should be supported with a sufficient quantity of clean small stones or pebbles to allow the developed plants to retain their upright position. Water should then be poured over the stones until it reaches the base of the bulbs. The bowl should now be kept in a cool, dark place until the roots have attained a good growth, care being taken to replace the water as it diminishes. When the bulbs are required to bloom, the bowl should be removed into a light, warm atmosphere, when spikes of blossoms will soon be thrown up.

Besides the Chinese sacred lily or narcissus, many other bulbs can be made to produce blossom in this manner. Among these hyacinths, jonquils and crocuses have all produced satisfactory results.

AMATEUR FLOWER GROWING.
The soil for planting flower seeds or plants of any kind should be mellow and rich, that will not easily pack and become soggy.
In starting flower seeds of any kind only heat and moisture are required until they sprout through the ground. Always press the earth down firmly after sowing all flower seeds, else there is danger of their drying up before their roots get a firm hold of the soil.

Nearly all flowers will bear transplanting. Sweet peas and poppies are usually sowed where they are to grow.

It is best, especially for beginners, to start the season with too large a collection. Choose those which are easiest to cultivate and most certain to bloom.

A frequent stirring of the top soil will aid the plant in making a healthy growth and help to keep the entire soil sweet and clean.

Small Boy (just home from school)—Mamma, Miss Simpson says I'm descended from a monkey.
His mother (glancing severely at her husband)—Not on my side, darling.—Harper's Weekly.

HOUSEHOLD.—Evening Prayer; How He Got His Nest Egg; Cottage or Dutch Cheese; Sauces for Puddings; Homely Hints, 452, 453.
PRODUCE MARKETS.—Los Angeles Market; San Francisco Market; Eastern Citrus Markets; Citrus Shipments; Local Citrus Conditions, 454, 455.

SPECIAL STOCK NUMBER.

It had been expected to make this issue of the Cultivator a special live stock number, containing articles written by California live stock breeders. The articles have already been received, but we are compelled to disappoint our readers, and ourselves, by deferring the issue one week.

We are able to place the blame entirely on the railroads. Not because that is popular these days, but because they have failed to deliver our car of paper in which the large size paper is contained.

If it takes a bigger sheet to produce a 32-page paper than Los Angeles contains, so we are compelled to wait one week for it to come.

Next week the various breeds of live stock will have possession of the paper and we have some fine articles in hand which will make that issue of value to all lovers of live stock.

Another special issue will be devoted to poultry on December 12, and in January the citrus industry will be given especial attention.

STATE FRUIT GROWERS.

The call to the thirty-third State Fruit Growers' Convention to be held at Marysville, December third to sixth, is issued by State Commissioner Jeffrey and Secretary Isaac.

The object of these Conventions is to bring together the various branches of our greatest industry, to get them into closer relations.

To exchange views and experiences upon all

matters bearing upon fruit-growing, and upon all horticultural matters.

To secure better results for our labors and better markets for our products.

To these ends papers will be presented and addresses made upon all subjects bearing on the fruit industry. These will be open for discussion, and all questions germane to the subject will be answered.

These Conventions have steadily increased in interest from their commencement thirty years ago; have been largely the cause of the great growth of the fruit industry, and have been of incalculable value to the growers of the State, and it is determined to make this, the thirty-third, the best and most comprehensive that has ever been held.

Very many questions of vital importance to all who are concerned in the fruit industry, in any of its branches, will come before the Convention for discussion and consideration, and it is directly to the interest of all to be present.

Arrangements have been made for hotel accommodations, and a local committee will meet all members of the Convention and see that suitable accommodations are furnished each one.

Arrangements will also be made for entertainments and excursions, and every effort will be put forth to make this Convention the best ever held, and the whole affair a most enjoyable one to all who attend.

INEFFICIENT FARM LABOR.

Granting the claim of certain bear organs that this country is to witness a period of hard times lasting several months, there is the question of what will become of the laboring classes during the existence of this period of depression?

It is an open and notorious fact that these never was a time in our history when labor, in all departments of our national industry, was as inefficient as it is today. It extends to each and every calling and is particularly emphasized in the agricultural field. The trouble seems to arise from the tremendous business we are doing, when every workingman seems to feel that he can find employment, anywhere and any time, without regard to how he performs his labor. In general, he has been right, but with a change coming in the volume of business we are to do, will also come a change in the affairs of the workingman.

The task of weeding out the slipshod and shiftless will begin with the falling off of business, if it falls at all, and the first to suffer will be the inefficient laborer. The painstaking, honest, efficient workingman will hold his job, while the inefficient and lazy man will find a prompt discharge.

With no class of employers is this condition more to be expected than with the farmers of the country. They have suffered long and patiently, for they have been most wickedly imposed upon, and they will find early opportunity to rid themselves of the lazy laborers who have had them at their mercy. Not so independent will be the dairy milkers, nor the field hands, nor, indeed, the working girls, for hard times will bring curtailment of household expenses and consequent discharge of the slatternly housemaid. During the past two years the scarcity of help has led to a false presumption, on the part of day laborers, that a job could quickly be secured, no matter what the conditions imposed might be, and this belief has tended to demoralize labor throughout the country. From this idea the farmer has suffered most of all employing classes.

The "Iron Age," although an industrial magazine, states the truth as it applies not only to manufacturers, but to the agricultural classes, when it says:

"The fact will be firmly realized soon that steadiness, reasonable industry, and acquiescence in necessary measures of discipline are primary conditions for employment, and that simple application for work is not the only qualification.

"There is every reason to hope, too, that a lessened demand for labor will be reflected in better quality of work, although in that respect deeper causes have been operative than temporary high pressure of production. The effect of leveling down which has been the curse of the labor unions can not be so quickly eradicated. It is true that the concentration of industry into larger units tends to deprive an individual workman of hope of starting on his own account,

Shop Talk

Perhaps you noticed last week our change in plan in handling subscriptions.

That is, instead of the traveling solicitor coming once a year at your home, the office comes in direct contact with you through mail.

We think it will be better, quicker and more satisfactory to you and to us.

We will send you a little reminder by mail. It will contain a return addressed envelope with blank. Just a moment will be required to fill out and return with the dollar for next year.

Then while writing, of course, you will want to say wherein you want the paper different. Or, send the query you have long been thinking of asking or saying something which brings us closer together.

Then we will have a better paper and will get more out of it, for it's more yours.

Also, while you're sending in, why not neighbor Jones and suggest sending his too? That's a good way of making a paper better.

We trust none will feel slighted if we do not get our little note to you at once. It is a time to get in touch with twelve thousand folks.

It doesn't sound so big, but look at this paper you are holding? It is small and well worth practically nothing.

Yet, 12,000 like it piled in mail sacks on a dray makes a load of over a ton of mail.

Next week it will be well up towards a ton, for that is a larger issue on account of the special stock number.

Should you be impatient at the waiting notice from the office, write in direct. Get to hear from you at all times.

If you ever want address of paper changed, be sure and give old as well as new address.

We're at loss to find your name if you don't.

Also when remitting, be sure and give full address and whether a new or old subscriber.

Watch the label on your paper; it will change within a week or two after you receive it.

Young men have often written in to learn if they could not represent the Cultivator in their section. Heretofore, this conflict with the regular agents. But now we are right in line for that class of young folks.

Christmas will soon be here and a little money will look good. Write us, Circulation Department, and let us show you how to get some of it.

and the necessity for preliminary scientific and technical training is closing him out of the range once open to him, of managers and superintendents. It is further true that in the days of an extraordinary demand the manufacturer has often permitted or even encouraged some sacrifice of quality for the sake of quantity. But granting that all these factors have been at work, there remains a residuum of wretched work which must be directly charged to the spirit in which labor is facing its tasks. It almost seems as though the hard school of adversity can alone bring about a realization of the fact that the world owes living only to those who deserve it."

The farmer will be the first to profit by the changed condition if it should come.

In connection with the copious rains which have fallen somewhat early in the season, let us refer to the roads. The fall is that ideal season for road repair. Work done at this season, especially after rain, will be of value the entire winter through. In adobe soil, or any heavy land, go over the road with a King road drag, fill up all chuck holes and smooth the surface. Let rains will harden the crown and render it durable for a long time. Remember every half dollar you can spare on the road will be money to you and your neighbors in time saved and wear on horses and vehicles. The crying need of the time is for better roads in California.

Agricultural Notes of the Pacific Coast

Northern California

Colusa is harvesting a large crop of alfalfa seed.

Humboldt county is shipping apples to Australia.

Dogs have killed many sheep on the ranches near Colusa.

The recent rain did much damage to the later table grapes.

The dredgers at Oroville are still causing great damage to agricultural interests.

The Butte County Citrus Association has built a new packing house at Oroville.

Siskiyou county live stock dealers have suffered great loss on account of car shortage.

Peach orchardists of the upper Sacramento valley claim this to be the greatest year ever.

The Alta-California Beet Sugar Company, near Chico, has closed operations for this season.

Three hundred cars of grapes from the little town of Florin brings to that section over \$400,000.

There will be a large increase in the average of potatoes next season along the lower Sacramento.

Nevada county farmers are preparing for institutes to be held November 19th and 20th at Grass valley.

Butte County Canal Company is soon to begin the construction of a dam at the head of the Butte county canal.

The California Creamery Operators' Association holds its annual meeting at Davisville, November 22d and 23d.

Robert Ashburner, one of the best known cattle breeders in California, died at his home near Woodland, last week.

A prominent turfman has recently made a purchase near Woodland on which he expects to start a breeding farm for race horses.

Secretary of the Interior Garfield has approved the plans for the Orland irrigation project. This will involve the expenditure of \$650,000.

Sonoma county Board of Supervisors are offering to raise the bounty of coyote scalps from \$5 to \$10, providing Napa county will do the same.

Prof. Hussman, in charge of the Government Experimental Station at Lodi, is endeavoring to produce a grape which will excel the Flame Tokay.

The Colusa county Chamber of Commerce is making a fine display of Franquette walnuts, and it is said they are exceedingly profitable in that section.

An alfalfa grower near Gridley has had excellent returns from sowing gypsum broadcast over the crops, which far more than paid for the additional cost.

State Forester Lull was boycotted at a lecture which he was to deliver on forestry, and only two attendants were at the meeting. This was because of a factional fight over an irrigation project.

It is claimed that the Century Mercantile Company has been of great advantage to wool growers about Dixon and other northern points, because of having broken the combine amongst other buyers.

Central California

Fresno is planning for a citrus fair to be held in January.

The winery at Turlock has crushed fifty per cent more grapes than last year.

Two cars of Turlock Thompson seedless grapes brought \$3000 a car in New York.

The prune market is said to be rather quiet, as the packers are loaded with fruit.

Fresno packing houses and seedling plants are handicapped by the shortage of labor.

The precipitation in eastern Tulare county to date amounts to nearly one inch and a half.

One concern at Tres Pinos made a sale of a thousand tons of hay to a large construction concern.

The Farmers' Co-operative Marketing Organization at Turlock is getting closer to a working basis.

The Turlock Journal is urging the planting of large quantities of garden peas to catch the early market.

Exeter claims to be the first to send out a car of Red Emperor grapes from that section of the San Joaquin valley.

The white orange pickers at Porterville are making a strong fight against the allowing of Japs in that section.

A new machine is being perfected at one of the packing houses at Fresno which fills, weighs and buttons cartons.

The recent rains over the valley caught some of the second-crop raisins, but the great bulk of the crop is off and safely housed.

Nearly all of the fish in the Salinas river are being destroyed by the discharge of certain chemicals from the Spreckle's sugar factory.

The Pajaro valley fair, or apple and strawberry festival, which closed last week was a great big success from all standpoints.

The shipments of apples from Watsonville station amount to about one thousand carloads to this date. This is slightly in advance of last year.

Some growers have delivered raisins to the packing houses so wet from recent rains that they were compelled to take them home and re-dry.

The pulling of beets at Salinas has been stopped by the recent storm, which amounted to nearly one inch. No more beets will be received at the factory this season.

The different sections coming into line with promise of good exhibits at the coming citrus fair at Lindsay, indicate the greatest fair in the history of Tulare county.

Campbell prune growers have formed a pool and agreed with each other not to sell until satisfactory prices are secured. There are thirty-four producers in the pool.

The Visalia Delta says that at the recent fair pumpkins were exhibited that would dress one hundred and fifty pounds and make one hundred and fifty pies "the kind that mother used to make." All Tulare county needs is the girl to make the crust.

Southern California

Long Beach has an ostrich farm.

Redlands is to have a new olive oil factory this fall.

San Dimas Lemon Association has shipped fruit to Japan this year.

Settlers in Imperial valley are winning in their suits to eject squatters.

Hundreds of acres of peanuts were greatly injured by the rains of last week.

Cucamonga and Etiwanda raisins were injured by the recent rain storms.

A car of grapefruit from Big Grove averaged \$8.80 per box in New York recently.

Brawley has experimented in the planting of beans, and is claimed to have made good.

The Chili pepper crop of Orange county will not be half as much as it was last year.

R. L. Bowler picked three hundred tons of tomatoes from twenty acres, at Pomona.

A Halloween "punkin" raised in Santa Ana tips the scales at one hundred and sixty pounds.

Rainfall to date this season over most sections of Southern California aggregates about three inches.

Yucaipe valley is making a fine display of apples in the Riverside Chamber of Commerce rooms.

San Diego county is swelled up over recent awards for her Julian apples at the Jamestown exposition.

Tustin has a cork oak which is not only a curiosity, but shows that cork may be produced in that section.

Hundreds of acres of poppy fields are planned for the hills back of Redlands and seed is now being planted.

Horticultural inspector, Day, of Pasadena, intercepted a package of small plants mailed from Florida and had the same destroyed.

The addition of 80x200 feet of the Upland citrus packing house under course of construction was destroyed last week by wind.

C. E. Bemis, of Covina, has been appointed to take the place of Commissioner Jeffrey of Los Angeles county, who resigned to accept his position as State Horticultural Commissioner.

The new directors of the Victoria Avenue Citrus Fruit Association are: B. F. Straight, S. J. Geo. Roudwaite, W. H. Robinson, James Mills, W. G. Fraser, W. H. Pilgrim, Mr. Whiffin, John W. B. Merriam and Mr. Edwards.

The orange growers of Riverside, in discussing the matter of labor for picking the coming crop, have generally decided that Japanese were so objectionable that an effort is being made to secure Mexican helpers. They fear that the same condition may come to pass there which now prevails in Vacaville.

At a special meeting of the officers of the different organizations, J. W. Crump was elected manager of the Hemet Land & Water Companies, vice-president of the bank of Hemet and secretary of the Hemet Land and Water Companies to take the place of P. N. Myers whose resignation was accepted at that time.

The Coast

Tacoma, Wash., is raising some fine Concord grapes.

Onions are now selling in Portland at \$2.25 per sack.

Oregon produces twenty million bushels of wheat.

Greeley, Colo., is to grow beet seed for commercial distribution.

The value of Colorado's beet crop this season has been \$15,750,000.

Denver hay dealers are shipping large quantities of alfalfa to the Middle West.

The Washington Good Roads Association holds its meeting November 12th and 13th.

Washington State Dairymen's Association will be held at Stanwood, December 18th and 20th.

The sugar factory at Waverly, Wash., was obliged to close down because of shortage of beets.

Over twenty-five hundred deer have been killed in the mountains of Colorado this open season.

The Gresham fruit fair and carnival, ending recently, was one of the most successful of its kind.

The Hood River apple crop, it is estimated, will be about one hundred and twenty thousand boxes.

A flour mill with twenty thousand bushels of wheat was destroyed at Fort Morgan, Colo., last week.

Yamhill county, Oregon, has recently planted between six and eight hundred acres of English walnuts.

After receiving freight cars for a short time the fruit growers of North Yakima are again suffering from shortage.

One million two hundred and sixty thousand cantaloupes were moved daily during the shipping season at Rocky Ford, Colo.

In addressing an audience of farmers at Bridgeport, Wash., Gov. Mead's platform was on top of a six-horse load of wheat.

The fifteenth annual international convention of the Northwest Fruit Growers' Association will be held in Vancouver, December 5 and 6.

The registration of the first three weeks of the Oregon Agricultural College showed an enrollment of eight hundred and seventy students.

A Hood River fruit grower who owns a coreless pear tree, has refused a \$2000 offer for it by a nursery company, which wished it for securing the cions from it.

The farmers in Weld county, Colorado, are organizing to send agents to New York and Galveston to bring emigrant families to do the common farm labor of that section.

Farmers' Institutes in Marion county, Oregon will be held as follows: Jefferson, November 12th; Aumsville, November 13th; Liberty, November 14th; Jervais, November 15th; Hubbard, November 16th.

The Oregon Legislature has enacted a law by which any unreasonable delay in supplying cars for transporting products may be charged up to the transportation company in the same way in which it charges demurrage on cars from which freight is not promptly unloaded.

MIDLAND

IF YOU WANT EGGS
YOU WILL FEED NO OTHER.

Used by all largest and best breeders in the country. Thousands of poultrymen are using it, and it is the acknowledged standard of the world. Haphazard feeding is no longer profitable. Try Midland Food and be convinced.

Petaluma Incubators and Brooders

The acknowledged standards of perfection. All poultrymen who have used these machines have supreme confidence in their ability to hatch and breed. Hence their ever increasing popularity. Winners of the Gold Medal at the St. Louis Worlds Fair for the greatest hatch, with 40 different makes of incubators in competition. How's that?

St. Louis, Mo., Dec. 8th, 1904.—Petaluma Incubator Co., Petaluma, Cal.: My dear Sir—The awards have been held up owing to a controversy between the Exposition officials and the national commission, but today I am able to state the award of a gold medal on your Petaluma Incubators has been confirmed. You are at liberty to make use of this in any way you see fit and in due time the diploma will be issued and the medal obtainable. Congratulating you upon this evidence of the merits of your incubators, in which there was very great competition, I beg to remain, yours very truly, J. A. Flicher, Commissioner.

And Now Comes New Reward for Merit

Read the following telegram received from the Lewis & Clark Exposition at Portland.
"Petaluma Incubators and Brooders just awarded Gold Medal at Lewis and Clark Exposition."

Profit in the Poultry Yard

We solicit short articles of a practical nature from the fancier and utility breeder, giving their experiences with poultry. All inquiries pertaining to feed management, disease and its prevention will be answered through these columns.

BRFEDERS' ASSOCIATION MEETING.

THE regular monthly meeting of the Poultry Breeders' Association of Southern California was held Thursday, Oct. 24th, in the Chamber of Commerce building. After the regular routine of business, at which time seventeen new members were admitted, the audience was favored with a scoring demonstration by Judge Gunston, the best informed Rhode Island Red judge on the Pacific Coast, who first scored a Buff Leghorn pullet, then a Buff Wyandotte pullet, but owing to the molting condition of the fowls a few imperfections had to be overlooked. The time allotted for this part of the entertainment was so limited that Judge Gunston was unable to take time to explain all his cuts and answer the many questions fired at him.

At the next meeting to be held Friday, Nov. 29th, Judge G. Goodacre will score Orpingtons, when we hope to be able to grant more time for this entertaining and instructive feature.

Following immediately after Judge Gunston, Mr. L. E. Berkey was called to talk on the subject of

Better Prices.

I have been given for my subject tonight, "Better Prices for Poultry and Eggs," but I believe that there are many present who are more competent to talk on this subject than I. It is a subject worthy of much thought, and before I speak of it I will take up a few preliminaries.

If I had no particular breed and was starting into the poultry business, then I would select some breed and ascertain who makes a specialty of producing laying birds of that breed. Several of the poultry experiment stations have done good work in developing good strains. There are two that have made more progress in this direction than the others; that is the station in Maine and the one in Utah. Prof. Crowell of the Maine station has been experimenting for a number of years with the Barred Rocks, and I believe with others, but these were his favorites, and he has carried them through until he has a great many hens that lay 200 or more eggs per year.

In the Utah station, the man in charge absolutely knew nothing about poultry, but was appointed through political influence, and was put to the task with an unbiased mind. He started in to ascertain which was the best breed, and soon learned that not so much depended on the breed as upon the strain. He had the best success with White Wyandottes and Brown Leghorns. This does not mean that these are necessarily the best breeds.

Now, how to arrive at this knowledge is a matter of opinion. From those who have already experimented along this line, we learn that about the best way is to select the best layers, the ones that lay the largest and most eggs and breed from them. In this way in the course of a few years you have developed a good laying strain, provided the strain has strength, which

is an important essential. So much for preliminaries.

What Fullerton Hoped to Do.

A brief study of some of the aims and hopes of the Fullerton association, although they have not lived up to them, may be of benefit to this Association. One of its first aims was to get a number of people together who would produce to buy all their stuff together, thus obtain a better grade and better prices. Their next aim was to obtain better prices for their product and to accomplish this, they wanted to market them together. This was not accomplished for several reasons. In the first place, it was considered that in order to secure the best prices for eggs they should be absolutely fresh. Eggs gathered every day and marketed once or twice a week should command higher prices than the average egg. Every grocer knows that out of a purchase of eggs, from some source or other, he will get eggs that are not fresh, and he knows that if he sends these to the produce men a certain number will come back; as the result is a lower price for eggs is paid by the merchants, than if the eggs were fresh and clean. Therefore, if by combining their production and taking it upon themselves to gather their eggs every day or every other day, their eggs would command better prices than the ordinary.

They hoped to inaugurate a system which would require a number of persons to go over a large area every day, say in the afternoon, to gather up all the eggs laid that day. If they were placed in new cartons, one, two or three dozen, and sold in that original package, sealed and stamped with the date when the eggs were laid, and were absolutely guaranteed, how much do you think those eggs would be worth more than the ordinary eggs? Do you think they are worth 10 cents more? It is worth about five cents for extra care and the merchant would be a great deal rather have them. I am certain the housewife would much prefer them. The Association at Fullerton thought that if the plan could be tried and carried out successfully in one community, that would result in several communities adopting the same plan, and all marketing their eggs under certain well known brands, and under these conditions their product would be placed on the market at advanced prices. At present the price of eggs is largely determined by the produce exchange, their method of determining the price is by buying all the eggs as cheaply as possible, and I believe that all the large dealers go together and control the surplus and market them at the advanced price themselves. It is a business proposition, which will require careful thought and attention to work out and is not necessarily a trust or monopoly in its execution.

Trap Nest.

I believe that every poultryman should trap-nest his birds, so that he can determine which are the best layers. The Hogan and Potter systems are both good, but with the

LILLY'S BEST SCRATCH FOOD

A perfectly balanced mixed grain feed strengthened with beef scraps, granulated bone, charcoal, grit and shell. It is rich in all the elements necessary to make hens lay and feathers grow. Practical poultrymen praise it highly.

"My chicks never laid more eggs than when I fed them Lilly's Best Scratch Food." J. F. JURGENSEN, San Jose, Cal.

"I never had such a wholesale production of eggs as I have since feeding your Scratch Food." J. W. DAKON, Burlington, Wn.

"I am getting more than one-third more eggs since using your Scratch Food." F. A. SMITH, Sedro-Woolley, Wn.

"My hens are laying lots more eggs since using Lilly's Best Scratch Food." L. FERRIS, Everett, Wn.

trap. nest he is less likely to make mistakes. By proper attention to your birds and the handling of their product, you can always obtain better prices than if they are neglected.

Now, I hope that these few suggestions will make things a little clearer and fix in your minds to such an extent that it will result in a move for better conditions.

AROUND THE YARDS.

Are you prepared for the winter?

* * *

The pure food law ought to be applied to the hen yard.

* * *

Don't feed on the ground, especially when it is muddy.

* * *

If you keep your birds busy they will not lose their appetites.

* * *

Ducks ought to be dry at night, so give them a nice dry place to roost in.

* * *

Don't allow the water to stand in pools in the yards; either drain or fill them up.

* * *

If your hens are through the molt now they are pretty certain to lay well this winter.

* * *

See that the laying hens are well supplied with lime in some form. If this is neglected, you are apt to have soft-shelled eggs.

* * *

There are 350,000,000 idle eggs in the cold storage warehouses of Chicago, which is 100,000,000 more than were in the freezers here last year.

* * *

It takes less capital to begin the poultry business than other lines. But it takes just as much brains and just as close application and as much work as any business, if we would succeed.

* * *

Whitewash.

Will you please send the White House wash for hen houses through your valuable paper.—A Reader of many years, Tulare.

The whitewash used by the U. S. government is made as follows:

Slake in boiling water one-half bushel of lime. Strain so as to remove the sediment. Add two pounds of sulphate of zinc; one pound of common salt and one-half pound whiting, thoroughly dissolve. Mix to the proper consistency with skim milk, if possible; if not, use hot water. This can be colored if desired by using yellow ocre, lamp black, etc., and is a good substitute both in appearance and durability, with a good quality of paint.

* * *

Breeding Reds and Andalusians.

Is double-mating system used in breeding Blue Andalusians and Rhode Island Red chickens? Is it advisable? What publications deal most extensively and practically on their utility and show records, their breeding and care?—R. K. H., Olin-da, Shasta county.

We know of no one that uses the double-mating system in breeding Andalusians or Rhode Island Reds, although some may practice same. We would not advise the double-mating system for the above breeds; many breeders in breeding exhibition Barred Plymouth Rocks, Brown Leghorns and Indian Games practice the double-mating system.

We know of no work published on Andalusians. The Rhode Island Red Club issues a club catalogue called "Red Hen Tales," which contains

After selecting the nice, trim, shapely pullets for winter layers, fat the culls and young cockerels for early market. This is a profitable adjunct to the poultry business—and when properly carried on is like finding good money. Try it and make a good thing better by giving regular portions of

Dr. HESS Poultry PAN-A-CE-A

in some one of the daily feeds. Its use corrects any tendency toward indigestion and a consequent "going back" in the condition of the fowl. Poultry Pan-a-ce-a is the prescription of Dr. Hess (M. D., D. V. S.) and is endorsed by leading poultrymen and fanciers in both Canada and the United States. It is composed (besides bitter tonics for digestion) of iron for the blood and the cleansing nitrates which expel poisonous matter. It fats fowls in less time than can be done by any other way of feeding, makes chicks mature early and hens lay abundance of eggs. It is also a germicide and prevents disease. A penny's worth feeds 30 hens one day. Sold on a written guarantee.

1½ lbs. 35c.; 5 lbs. 85c.; 12 lbs. \$1.75; 25 lb. pail \$3.50.

Send 2 cents for Dr. Hess 48-page Poultry Book, free.

much information on the Rhode Island and Red. If you will write to E. L. Preckett, Hazardville Conn., enclosing ten cents, you will receive one of the books.

Suggestions and Plans.

Would it not be of general interest to get up some kind of competition plans or drawing for the best arranged and most convenient chicken yards; the many ideas submitted might help your readers to get suggestions that would assist them in their work and also be valuable for those starting new yards.— M. E. Mathews.

The above suggestion is a good one, and if the readers will send in their plans, the Cultivator will use the best, or what we consider worthy. That is, will have cuts made and run same in this department.

We would especially like to hear from our readers in the way of short articles or home remedies, for our Around the Yard column.

FARM DEDICATION.

Continued from First Page

izing of the intellect without regard to its human relationship or the conditions under which the man was to live. Its purpose was to spiritualize or humanize the mind independent of any other purpose. Its ideal was education for education's sake. In the schools dominated by such standards, the classics were taught, as were the languages, living and dead, mathematics and literature. The product of this system, in the better class of cases, was a delightfully cultivated man with refined tastes and delicate sensibilities, but utopian, idealistic and inefficient. He had learned neither man nor things, and the best that could be said of him was that he brought to this task a mind trained to think and a judgment strengthened by systematic cultivation. But when learning spread, when industry diversified, when education came to be looked upon without awe or blind veneration, it was plainly seen that by this process too many men were wasted, too few were helped. For the better type of men with certain aptitudes it was admirably adapted, but with respect to the great body of men, they were incapable of realizing its best results, while they suffered the detriment of being trained away from the realities of life without having been trained into any of its so-called higher purposes. The result was criticism of dead languages and wasted years, and a demand that men be taught in the schools the things they were to do in after life. So after centuries of forming judgment and decades of effort, the sciences were forced into the schools, and chemistry and physics and botany and geology and mechanics became regular subjects of instruction in our schools and colleges and universities. They were forced in from the outside because they were useful, and they were slowly and reluctantly accepted on the inside because of their cultural value. When the educational mind

became thus liberated it began to see things in their reality, and to have come to have a new conception of what constitutes sound mental training.

As a result, following science, we have admitted manual training, domestic economy and commercial courses into the schools with splendid results. We have found that while they were intensely practical, teaching the young man or woman the things he or she would later have to know and do, they have likewise contributed to the finest mental culture. Without enlarging upon the idea it is enough to say that the conquest of the previously scorned utilitarian in education has been complete, and the schoolmen have found that the highest purpose of education is to develop the well-balanced, completely rounded man, and this can only be done by training the heart, the head and the hand. The schools must cultivate the heart, that is, build character, they fail of their best purpose.

They must train the mind to its strength and health and sympathy. And lastly, and with great emphasis, they must train the hand, the foot, because of its educative reaction and because it is the only means through which the mind can get expression to its conceptions. In other words, education now recognizes its obligation to train the whole man and not a part of the man. The old division of subjects into cultural and utilitarian has been abandoned as artificial and arbitrary, and we have come to know that no thing or fact or factor of life lacks cultural value, provided it is truly viewed and is given its proper interpretation. Out of this conception has come the great movement for agricultural education which, tersely defined, means or teaching the things related to farm life in a broad and systematic way.

Our Duty—Our Opportunity.

Prof. E. J. Wickson was most heartily received, and in his address, said:

It is proposed to make this the greatest field of research in the world. Agriculture is mentioned as one of the principal subjects to be taught in the university. This was determined by the regents about eleven years ago, and that declaration has been adhered to. In 19 there were thirty-one pupils of agriculture. Now there are 124. The range of subjects and the number of instructors has increased proportionately. The attitude of the people toward it has been friendly, and the appropriations for it have increased steadily. No other State presents such opportunities and conditions as this. We have here an epitome of the world's agriculture except of the tropical products, there is no State where the people uphold it more fully, nor one in which agriculture is so highly thought of by non-agriculturalists. Our duty, then, is defined by our opportunity. I laid down the system to be pursued in order to make the most of our possibilities. Three things are needed to secure the best results—money and the time to work together.

Teaching Dairying From a Picture of a Cow.
